Overview

Built-In Functions 1

1. Void Functions 2
   1.1 Print statement 2
   1.2 Reject statement 2

2. Integer-Valued Basic Functions 4
   2.1 Integer-valued arithmetic operators 4
   2.2 Absolute functions 6
   2.3 Bound functions 7
   2.4 Size functions 7
   2.5 Casting functions 8

3. Real-Valued Basic Functions 9
   3.1 Vectorization of real-valued functions 9
   3.2 Mathematical constants 14
   3.3 Special values 15
   3.4 Log probability function 15
   3.5 Logical functions 16
   3.6 Real-valued arithmetic operators 20
   3.7 Step-like functions 21
   3.8 Power and logarithm functions 24
   3.9 Trigonometric functions 25
   3.10 Hyperbolic trigonometric functions 26
   3.11 Link functions 27
   3.12 Probability-related functions 27
   3.13 Combinatorial functions 28
   3.14 Composed functions 34
   3.15 Special functions 37
4. **Complex-Valued Basic Functions** 38
   4.1 Complex assignment and promotion 38
   4.2 Complex constructors and accessors 38
   4.3 Complex arithmetic operators 39
   4.4 Complex comparison operators 41
   4.5 Complex (compound) assignment operators 42
   4.6 Complex special functions 42
   4.7 Complex exponential and power functions 44
   4.8 Complex trigonometric functions 45
   4.9 Complex hyperbolic trigonometric functions 46

5. **Array Operations** 48
   5.1 Reductions 48
   5.2 Array size and dimension function 52
   5.3 Array broadcasting 53
   5.4 Array concatenation 54
   5.5 Sorting functions 55
   5.6 Reversing functions 56

6. **Matrix Operations** 57
   6.1 Integer-valued matrix size functions 57
   6.2 Matrix arithmetic operators 58
   6.3 Transposition operator 61
   6.4 Elementwise functions 62
   6.5 Dot products and specialized products 64
   6.6 Reductions 67
   6.7 Broadcast functions 70
   6.8 Diagonal matrix functions 71
   6.9 Container construction functions 72
   6.10 Slicing and blocking functions 74
   6.11 Matrix concatenation 76
   6.12 Special matrix functions 78
   6.13 Gaussian Process Covariance Functions 79
   6.14 Linear algebra functions and solvers 85
6.15  Sort functions  93
6.16  Reverse functions  94

7.  **Complex Matrix Operations**  95
    7.1  Complex promotion  95
    7.2  Integer-valued complex matrix size functions  96
    7.3  Complex matrix arithmetic operators  97
    7.4  Complex Transposition Operator  100
    7.5  Complex elementwise functions  101
    7.6  Dot products and specialized products for complex matrices  103
    7.7  Complex reductions  105
    7.8  Vectorized accessor functions  106
    7.9  Complex broadcast functions  107
    7.10  Diagonal complex matrix functions  107
    7.11  Slicing and blocking functions for complex matrices  108
    7.12  Complex matrix concatenation  109
    7.13  Complex special matrix functions  111
    7.14  Complex linear algebra functions  113
    7.15  Reverse functions for complex matrices  116

8.  **Sparse Matrix Operations**  117
    8.1  Compressed row storage  117
    8.2  Conversion functions  118
    8.3  Sparse matrix arithmetic  119

9.  **Mixed Operations**  120

10.  **Compound Arithmetic and Assignment**  127
    10.1  Compound addition and assignment  127
    10.2  Compound subtraction and assignment  127
    10.3  Compound multiplication and assignment  127
    10.4  Compound division and assignment  128
    10.5  Compound elementwise multiplication and assignment  128
    10.6  Compound elementwise division and assignment  128

11.  **Higher-Order Functions**  129
11.1 Algebraic equation solvers 129
11.2 Ordinary differential equation (ODE) solvers 132
11.3 Differential-Algebraic equation (DAE) solver 136
11.4 1D integrator 139
11.5 Reduce-sum function 141
11.6 Map-rect function 143

12. Deprecated Functions 145
12.1 Integer division with operator/ 145
12.2 integrate_ode_rk45, integrate_ode_adams, integrate_ode_bdf ODE Integrators 145
12.3 algebra_solver, algebra_solver_newton algebraic solvers 148

13. Removed Functions 151
13.1 multiply_log and binomial_coefficient_log functions 151
13.2 get_lp() function 151
13.3 fabs function 151
13.4 Exponentiated quadratic covariance functions 151
13.5 Real arguments to logical operators operator&&, operator||, and operator! 152

14. Conventions for Probability Functions 153
14.1 Suffix marks type of function 153
14.2 Argument order and the vertical bar 153
14.3 Sampling notation 153
14.4 Finite inputs 154
14.5 Boundary conditions 154
14.6 Pseudorandom number generators 154
14.7 Cumulative distribution functions 154
14.8 Vectorization 155

Discrete Distributions 159

15. Binary Distributions 160
15.1 Bernoulli distribution 160
15.2 Bernoulli distribution, logit parameterization 161
15.3 Bernoulli-logit generalized linear model (Logistic Regression) 162

16. **Bounded Discrete Distributions**  165
   16.1 Binomial distribution  165
   16.2 Binomial distribution, logit parameterization  166
   16.3 Binomial-logit generalized linear model (Logistic Regression)  167
   16.4 Beta-binomial distribution  169
   16.5 Hypergeometric distribution  171
   16.6 Categorical distribution  172
   16.7 Categorical logit generalized linear model (softmax regression)  173
   16.8 Discrete range distribution  175
   16.9 Ordered logistic distribution  176
   16.10 Ordered logistic generalized linear model (ordinal regression)  177
   16.11 Ordered probit distribution  179

17. **Unbounded Discrete Distributions**  181
   17.1 Negative binomial distribution  181
   17.2 Negative binomial distribution (alternative parameterization)  182
   17.3 Negative binomial distribution (log alternative parameterization)  184
   17.4 Negative-binomial-2-log generalized linear model (negative binomial regression)  184
   17.5 Poisson distribution  187
   17.6 Poisson distribution, log parameterization  188
   17.7 Poisson-log generalized linear model (Poisson regression)  188

18. **Multivariate Discrete Distributions**  191
   18.1 Multinomial distribution  191
   18.2 Multinomial distribution, logit parameterization  192
   18.3 Dirichlet-multinomial distribution  193

**Continuous Distributions**  194

19. **Unbounded Continuous Distributions**  195
   19.1 Normal distribution  195
   19.2 Normal-id generalized linear model (linear regression)  198
   19.3 Exponentially modified normal distribution  201
19.4 Skew normal distribution 202
19.5 Student-t distribution 203
19.6 Cauchy distribution 205
19.7 Double exponential (Laplace) distribution 206
19.8 Logistic distribution 207
19.9 Gumbel distribution 208
19.10 Skew double exponential distribution 209

20. Positive Continuous Distributions 212
20.1 Lognormal distribution 212
20.2 Chi-square distribution 213
20.3 Inverse chi-square distribution 214
20.4 Scaled inverse chi-square distribution 215
20.5 Exponential distribution 216
20.6 Gamma distribution 217
20.7 Inverse gamma Distribution 218
20.8 Weibull distribution 219
20.9 Frechet distribution 220
20.10 Rayleigh distribution 221
20.11 Log-logistic distribution 222

21. Positive Lower-Bounded Distributions 224
21.1 Pareto distribution 224
21.2 Pareto type 2 distribution 225
21.3 Wiener First Passage Time Distribution 226

References  265
Overview

This is the reference for the functions defined in the Stan math library and available in the Stan programming language.

The Stan project comprises a domain-specific language for probabilistic programming, a differentiable mathematics and probability library, algorithms for Bayesian posterior inference and posterior analysis, along with interfaces and analysis tools in all of the popular data analysis languages.

In addition to this reference manual, there is a user’s guide and a language reference manual for the Stan language and algorithms. The Stan User’s Guide provides example models and programming techniques for coding statistical models in Stan. The Stan Reference Manual specifies the Stan programming language and inference algorithms.

There is also a separate installation and getting started guide for each of the Stan interfaces (R, Python, Julia, Stata, MATLAB, Mathematica, and command line).

Interfaces and platforms
Stan runs under Windows, Mac OS X, and Linux.

Stan uses a domain-specific programming language that is portable across data analysis languages. Stan has interfaces for R, Python, Julia, MATLAB, Mathematica, Stata, and the command line, as well as an alternative language interface in Scala. See the web site https://mc-stan.org for interface-specific links and getting started instructions.

Web site
The official resource for all things related to Stan is the web site:

https://mc-stan.org

The web site links to all of the packages comprising Stan for both users and developers. This is the place to get started with Stan. Find the interface in the language you want to use and follow the download, installation, and getting started instructions.

GitHub organization
Stan’s source code and much of the developer process is hosted on GitHub. Stan’s organization is:
https://github.com/stan-dev

Each package has its own repository within the stan-dev organization. The website is also hosted and managed through GitHub. This is the place to peruse the source code, request features, and report bugs. Much of the ongoing design discussion is hosted on the GitHub Wiki.

Forums
Stan hosts message boards for discussing all things related to Stan.

https://discourse.mc-stan.org

This is the place to ask questions about Stan, including modeling, programming, and installation.

Licensing
- Computer code: BSD 3-clause license

The core C++ code underlying Stan, including the math library, language, and inference algorithms, is licensed under the BSD 3-clause licensed as detailed in each repository and on the web site along with the distribution links.

- Logo: Stan logo usage guidelines

Acknowledgements
The Stan project could not exist without the generous grant funding of many grant agencies to the participants in the project. For more details of direct funding for the project, see the web site and project pages of the Stan developers.

The Stan project could also not exist without the generous contributions of its users in reporting and in many cases fixing bugs in the code and its documentation. We used to try to list all of those who contributed patches and bug reports for the manual here, but when that number passed into the hundreds, it became too difficult to manage reliably. Instead, we will defer to GitHub (link above), where all contributions to the project are made and tracked.

Finally, we should all thank the Stan developers, without whom this project could not exist. We used to try and list the developers here, but like the bug reporters, once the list grew into the dozens, it became difficult to track. Instead, we will defer to the Stan web page and GitHub itself for a list of core developers and all developer contributions respectively.
Built-In Functions
1. Void Functions

Stan does not technically support functions that do not return values. It does support two types of statements, one printing and one for rejecting outputs.

Although print and reject appear to have the syntax of functions, they are actually special kinds of statements with slightly different form and behavior than other functions. First, they are the constructs that allow a variable number of arguments. Second, they are the only constructs to accept string literals (e.g., "hello world") as arguments. Third, they have no effect on the log density function and operate solely through side effects.

The special keyword void is used for their return type because they behave like variadic functions with void return type, even though they are special kinds of statements.

1.1. Print statement

Printing has no effect on the model’s log probability function. Its sole purpose is the side effect (i.e., an effect not represented in a return value) of arguments being printed to whatever the standard output stream is connected to (e.g., the terminal in command-line Stan or the R console in RStan).

void print(T1 x1, ..., TN xN)
Print the values denoted by the arguments x1 through xN on the output message stream. There are no spaces between items in the print, but a line feed (LF; Unicode U+000A; C++ literal '\n') is inserted at the end of the printed line. The types T1 through TN can be any of Stan’s built-in numerical types or double quoted strings of characters (bytes).

Available since 2.1

1.2. Reject statement

The reject statement has the same syntax as the print statement, accepting an arbitrary number of arguments of any type (including string literals). The effect of executing a reject statement is to throw an exception internally that terminates the current iteration with a rejection (the behavior of which will depend on the algorithmic context in which it occurs).

void reject(T1 x1, ..., TN xN)
Reject the current iteration and print the values denoted by the arguments \( x_1 \) through \( x_N \) on the output message stream. There are no spaces between items in the print, but a line feed (LF; Unicode U+000A; C++ literal ‘\n’) is inserted at the end of the printed line. The types \( T_1 \) through \( T_N \) can be any of Stan’s built-in numerical types or double quoted strings of characters (bytes).

*Available since 2.18*
2. Integer-Valued Basic Functions

This chapter describes Stan’s built-in function that take various types of arguments and return results of type integer.

2.1. Integer-valued arithmetic operators

Stan’s arithmetic is based on standard double-precision C++ integer and floating-point arithmetic. If the arguments to an arithmetic operator are both integers, as in 2 + 2, integer arithmetic is used. If one argument is an integer and the other a floating-point value, as in 2.0 + 2 and 2 + 2.0, then the integer is promoted to a floating point value and floating-point arithmetic is used.

Integer arithmetic behaves slightly differently than floating point arithmetic. The first difference is how overflow is treated. If the sum or product of two integers overflows the maximum integer representable, the result is an undesirable wraparound behavior at the bit level. If the integers were first promoted to real numbers, they would not overflow a floating-point representation. There are no extra checks in Stan to flag overflows, so it is up to the user to make sure it does not occur.

Secondly, because the set of integers is not closed under division and there is no special infinite value for integers, integer division implicitly rounds the result. If both arguments are positive, the result is rounded down. For example, 1 / 2 evaluates to 0 and 5 / 3 evaluates to 1.

If one of the integer arguments to division is negative, the latest C++ specification (C++11), requires rounding toward zero. This would have 1 / 2 and -1 / 2 evaluate to 0, -7 / 2 evaluate to -3, and 7 / 2 evaluate to 3. Before the C++11 specification, the behavior was platform dependent, allowing rounding up or down. All compilers recent enough to be able to deal with Stan’s templating should follow the C++11 specification, but it may be worth testing if you are not sure and plan to use integer division with negative values.

Unlike floating point division, where 1.0 / 0.0 produces the special positive infinite value, integer division by zero, as in 1 / 0, has undefined behavior in the C++ standard. For example, the clang++ compiler on Mac OS X returns 3764, whereas the g++ compiler throws an exception and aborts the program with a warning. As with overflow, it is up to the user to make sure integer divide-by-zero does not occur.
Binary infix operators

Operators are described using the C++ syntax. For instance, the binary operator of addition, written $X + Y$, would have the Stan signature `int operator+(int, int)` indicating it takes two real arguments and returns a real value. As noted previously, the value of integer division is platform-dependent when rounding is platform dependent before C++11; the descriptions below provide the C++11 definition.

```cpp
int operator+(int x, int y)
The sum of the addends $x$ and $y$
operator+($x, y$) = ($x + y$)
```

Available since 2.0

```cpp
int operator-(int x, int y)
The difference between the minuend $x$ and subtrahend $y$
operator-($x, y$) = ($x - y$)
```

Available since 2.0

```cpp
int operator*(int x, int y)
The product of the factors $x$ and $y$
operator*($x, y$) = ($x \times y$)
```

Available since 2.0

```cpp
int operator/(int x, int y)
The integer quotient of the dividend $x$ and divisor $y$
operator/($x, y$) = \[
\begin{cases}
[x/y] & \text{if } x/y \geq 0 \\
-\lfloor -x/y \rfloor & \text{if } x/y < 0.
\end{cases}
\]
deprecated; use operator\%/\% instead.
Available since 2.0, deprecated in 2.24

```cpp
int operator\%/\%(int x, int y)
The integer quotient of the dividend $x$ and divisor $y$
operator\%/\%($x, y$) = \[
\begin{cases}
[x/y] & \text{if } x/y \geq 0 \\
-\lfloor -x/y \rfloor & \text{if } x/y < 0.
\end{cases}
\]
Available since 2.24

```c
int operator%(int x, int y)
```
x modulo y, which is the positive remainder after dividing x by y. If both x and y are non-negative, so is the result; otherwise, the sign of the result is platform dependent.

\[
\text{operator}\%(x, y) = x \mod y = x - y \times \lfloor x/y \rfloor
\]

Available since 2.13

**Unary prefix operators**

```c
int operator-(int x)
```
The negation of the subtrahend x

\[
\text{operator-}(x) = -x
\]

Available since 2.0

```c
T operator-(T x)
```
Vectorized version of `operator-`. If `T x` is a (possibly nested) array of integers, `-x` is the same shape array where each individual integer is negated.

Available since 2.31

```c
int operator+(int x)
```
This is a no-op.

\[
\text{operator+}(x) = x
\]

Available since 2.0

### 2.2. Absolute functions

```c
T abs(T x)
```
The absolute value of x.

This function works elementwise over containers such as vectors. Given a type `T` which is `int`, or an array of `ints`, `abs` returns the same type where each element has had its absolute value taken.

Available since 2.0, vectorized in 2.30

```c
int int_step(int x)
```
2.3. **BOUND FUNCTIONS**

int \texttt{int\_step}(\text{real } x)

Return the step function of \( x \) as an integer,

\[
\text{int\_step}(x) = \begin{cases} 
1 & \text{if } x > 0 \\
0 & \text{if } x \leq 0 \text{ or } x \text{ is } NaN
\end{cases}
\]

**Warning:** \texttt{int\_step}(0) and \texttt{int\_step}(NaN) return 0 whereas \texttt{step}(0) and \texttt{step}(NaN) return 1.

See the warning in section step functions about the dangers of step functions applied to anything other than data.

*Available since 2.0*

### 2.3. Bound functions

int \texttt{min}(\text{int } x, \text{int } y)

Return the minimum of \( x \) and \( y \).

\[
\text{min}(x,y) = \begin{cases} 
x & \text{if } x < y \\
y & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

int \texttt{max}(\text{int } x, \text{int } y)

Return the maximum of \( x \) and \( y \).

\[
\text{max}(x,y) = \begin{cases} 
x & \text{if } x > y \\
y & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

### 2.4. Size functions

int \texttt{size}(\text{int } x)

int \texttt{size}(\text{real } x)

Return the size of \( x \) which for scalar-valued \( x \) is 1

*Available since 2.26*
2.5. Casting functions

It is possible to cast real numbers to integers as long as the real value is data. See data only qualifiers in the Stan Reference Manual.

\[ \text{int } \text{to_int}(\text{data real } x) \]

Return the value \( x \) truncated to an integer. This will throw an error if the value of \( x \) is too big to represent as a 32-bit signed integer.

This is similar to \( \text{trunc} \) (see Rounding functions) but the return type is of type \( \text{int} \).

For example, \( \text{to_int}(3.9) \) is 3, and \( \text{to_int}(-3.9) \) is -3.

*Available since 2.31*

\[ \text{I } \text{to_int}(\text{data T } x) \]

The vectorized version of \( \text{to_int} \). This function accepts a (possibly nested) array of reals and returns an array of the same shape where each element has been truncated to an integer.

*Available since 2.31*
3. Real-Valued Basic Functions

This chapter describes built-in functions that take zero or more real or integer arguments and return real values.

3.1. Vectorization of real-valued functions

Although listed in this chapter, many of Stan’s built-in functions are vectorized so that they may be applied to any argument type. The vectorized form of these functions is not any faster than writing an explicit loop that iterates over the elements applying the function—it’s just easier to read and write and less error prone.

Unary function vectorization

Many of Stan’s unary functions can be applied to any argument type. For example, the exponential function, \( \exp \), can be applied to \( \text{real} \) arguments or arrays of \( \text{real} \) arguments. Other than for integer arguments, the result type is the same as the argument type, including dimensionality and size. Integer arguments are first promoted to real values, but the result will still have the same dimensionality and size as the argument.

Real and real array arguments

When applied to a simple real value, the result is a real value. When applied to arrays, vectorized functions like \( \exp() \) are defined elementwise. For example,

```c++
// declare some variables for arguments
real x0;
array[5] real x1;
array[4, 7] real x2;
// ...
// declare some variables for results
real y0;
array[5] real y1;
array[4, 7] real y2;
// ...
// calculate and assign results
y0 = exp(x0);
y1 = exp(x1);
y2 = exp(x2);
```
When \( \exp \) is applied to an array, it applies elementwise. For example, the statement above,

\[
y_2 = \exp(x_2);
\]

produces the same result for \( y_2 \) as the explicit loop

\[
\text{for } (i \text{ in } 1:4) \{ \\
\quad \text{for } (j \text{ in } 1:7) \{ \\
\quad \quad y_2[i, j] = \exp(x_2[i, j]); \\
\quad \} \\
\}\]

**Vector and matrix arguments**

Vectorized functions also apply elementwise to vectors and matrices. For example,

\[
\text{vector}[5] \ xv; \\
\text{row_vector}[7] \ xrv; \\
\text{matrix}[10, 20] \ xm;
\]

\[
\text{vector}[5] \ yv; \\
\text{row_vector}[7] \ yrv; \\
\text{matrix}[10, 20] \ ym;
\]

\[
yv = \exp(xv); \\
yrv = \exp(xrv); \\
ym = \exp(xm);
\]

Arrays of vectors and matrices work the same way. For example,

\[
\text{array}[12] \text{ matrix}[17, 93] \ u;
\]

\[
\text{array}[12] \text{ matrix}[17, 93] \ z;
\]

\[
z = \exp(u);
\]

After this has been executed, \( z[i, j, k] \) will be equal to \( \exp(u[i, j, k]) \).

**Integer and integer array arguments**

Integer arguments are promoted to real values in vectorized unary functions. Thus if \( n \) is of type \( \text{int} \), \( \exp(n) \) is of type \( \text{real} \). Arrays work the same way, so that if \( n_2 \) is a one dimensional array of integers, then \( \exp(n_2) \) will be a one-dimensional array of reals with the same number of elements as \( n_2 \). For example,
3.1. VECTORIZATION OF REAL-VALUED FUNCTIONS

It would be illegal to try to assign \( \exp(n1) \) to an array of integers; the return type is a real array.

**Binary function vectorization**

Like the unary functions, many of Stan’s binary functions have been vectorized, and can be applied elementwise to combinations of both scalars or container types.

**Scalar and scalar array arguments**

When applied to two scalar values, the result is a scalar value. When applied to two arrays, or combination of a scalar value and an array, vectorized functions like \( \text{pow}() \) are defined elementwise. For example,

```plaintext
// declare some variables for arguments
real x00;
real x01;
array[5] real x10;
array[5] real x11;
array[4, 7] real x20;
array[4, 7] real x21;
// ...
// declare some variables for results
real y0;
array[5] real y1;
array[4, 7] real y2;
// ...
// calculate and assign results
y0 = pow(x00, x01);
y1 = pow(x10, x11);
y2 = pow(x20, x21);
```

When \( \text{pow} \) is applied to two arrays, it applies elementwise. For example, the statement above,

```plaintext
y2 = pow(x20, x21);
```

produces the same result for \( y2 \) as the explicit loop
for (i in 1:4) {
  for (j in 1:7) {
    y2[i, j] = pow(x20[i, j], x21[i, j]);
  }
}

Alternatively, if a combination of an array and a scalar are provided, the scalar value is broadcast to be applied to each value of the array. For example, the following statement:

```
y2 = pow(x20, x00);
```

produces the same result for y2 as the explicit loop:

```
for (i in 1:4) {
  for (j in 1:7) {
    y2[i, j] = pow(x20[i, j], x00);
  }
}
```

**Vector and matrix arguments**

Vectorized binary functions also apply elementwise to vectors and matrices, and to combinations of these with scalar values. For example,

```cpp
real x00;
vector[5] xv00;
vector[5] xv01;
row_vector[7] xrv;
matrix[10, 20] xm;

vector[5] yv;
row_vector[7] yrv;
matrix[10, 20] ym;

yv = pow(xv00, xv01);
yrv = pow(xrv, x00);
ym = pow(x00, xm);
```

Arrays of vectors and matrices work the same way. For example,

```cpp
array[12] matrix[17, 93] u;
```
array[12] matrix[17, 93] z;

z = pow(u, x00);

After this has been executed, \( z[i, j, k] \) will be equal to \( \text{pow}(u[i, j, k], x00) \).

**Input & return types**

Vectorised binary functions require that both inputs, unless one is a real, be containers of the same type and size. For example, the following statements are legal:

```plaintext
vector[5] xv;
row_vector[7] xrv;
matrix[10, 20] xm;

vector[5] yv = pow(xv, xv)
row_vector[7] yrv = pow(xrv, xrv)
matrix[10, 20] = pow(xm, xm)
```

But the following statements are not:

```plaintext
vector[5] xv;
vector[7] xv2;
row_vector[5] xrv;

// Cannot mix different types
vector[5] yv = pow(xv, xrv)

// Cannot mix different sizes of the same type
vector[5] yv = pow(xv, xv2)
```

While the vectorized binary functions generally require the same input types, the only exception to this is for binary functions that require one input to be an integer and the other to be a real (e.g., `bessel_first_kind`). For these functions, one argument can be a container of any type while the other can be an integer array, as long as the dimensions of both are the same. For example, the following statements are legal:

```plaintext
vector[5] xv;
matrix[5, 5] xm;
array[5] int xi;
array[5, 5] int xii;
```
vector[5] yv = bessel_first_kind(xi, xv);
matrix[5, 5] ym = bessel_first_kind(xii, xm);

Whereas these are not:

vector[5] xv;
matrix[5, 5] xm;
array[7] int xi;

// Dimensions of containers do not match
vector[5] yv = bessel_first_kind(xi, xv);

// Function requires first argument be an integer type
matrix[5, 5] ym = bessel_first_kind(xm, xm);

3.2. Mathematical constants

Constants are represented as functions with no arguments and must be called as such. For instance, the mathematical constant $\pi$ must be written in a Stan program as pi().

real pi()
$\pi$, the ratio of a circle’s circumference to its diameter
*Available since 2.0*

real e()
e, the base of the natural logarithm
*Available since 2.0*

real sqrt2()
The square root of 2
*Available since 2.0*

real log2()
The natural logarithm of 2
*Available since 2.0*

real log10()
The natural logarithm of 10
*Available since 2.0*
3.3. Special values

**real not_a_number()**
Not-a-number, a special non-finite real value returned to signal an error
Available since 2.0

**real positive_infinity()**
Positive infinity, a special non-finite real value larger than all finite numbers
Available since 2.0

**real negative_infinity()**
Negative infinity, a special non-finite real value smaller than all finite numbers
Available since 2.0

**real machine_precision()**
The smallest number \( x \) such that \( (x + 1) \neq 1 \) in floating-point arithmetic on the current hardware platform
Available since 2.0

3.4. Log probability function

The basic purpose of a Stan program is to compute a log probability function and its derivatives. The log probability function in a Stan model outputs the log density on the unconstrained scale. A log probability accumulator starts at zero and is then incremented in various ways by a Stan program. The variables are first transformed from unconstrained to constrained, and the log Jacobian determinant added to the log probability accumulator. Then the model block is executed on the constrained parameters, with each sampling statement (~) and log probability increment statement (increment_log_prob) adding to the accumulator. At the end of the model block execution, the value of the log probability accumulator is the log probability value returned by the Stan program.

Stan provides a special built-in function `target()` that takes no arguments and returns the current value of the log probability accumulator. This function is primarily useful for debugging purposes, where for instance, it may be used with a print statement to display the log probability accumulator at various stages of execution to see where it becomes ill defined.

**real target()**
Return the current value of the log probability accumulator.
Available since 2.10

target acts like a function ending in \( _\text{lp} \), meaning that it may only may only be used in the model block.
3.5. Logical functions

Like C++, BUGS, and R, Stan uses 0 to encode false, and 1 to encode true. Stan supports the usual boolean comparison operations and boolean operators. These all have the same syntax and precedence as in C++; for the full list of operators and precedences, see the reference manual.

Comparison operators

All comparison operators return boolean values, either 0 or 1. Each operator has two signatures, one for integer comparisons and one for floating-point comparisons. Comparing an integer and real value is carried out by first promoting the integer value.

```plaintext
int operator<(int x, int y)

int operator<(real x, real y)
Return 1 if x is less than y and 0 otherwise.

operator<(x, y) = \begin{cases} 
1 & \text{if } x < y \\
0 & \text{otherwise}
\end{cases}

Available since 2.0

int operator<=(int x, int y)

int operator<=(real x, real y)
Return 1 if x is less than or equal y and 0 otherwise.

operator<=(x, y) = \begin{cases} 
1 & \text{if } x \leq y \\
0 & \text{otherwise}
\end{cases}

Available since 2.0

int operator>(int x, int y)

int operator>(real x, real y)
Return 1 if x is greater than y and 0 otherwise.

operator>(x, y) = \begin{cases} 
1 & \text{if } x > y \\
0 & \text{otherwise}
\end{cases}
```
Available since 2.0

\[
\text{int } \textbf{operator\textgreater=}(\text{int } x, \text{ int } y)
\]

\[
\text{int } \textbf{operator\textgreater=}(\text{real } x, \text{ real } y)
\]
Return 1 if \(x\) is greater than or equal to \(y\) and 0 otherwise.

\[
\text{operator\textgreater=} (x, y) = \begin{cases} 
1 & \text{if } x \geq y \\
0 & \text{otherwise}
\end{cases}
\]

Available since 2.0

\[
\text{int } \textbf{operator\textasciitilde\textasciitilde}(\text{int } x, \text{ int } y)
\]

\[
\text{int } \textbf{operator\textasciitilde\textasciitilde}(\text{real } x, \text{ real } y)
\]
Return 1 if \(x\) is equal to \(y\) and 0 otherwise.

\[
\text{operator\textasciitilde\textasciitilde} (x, y) = \begin{cases} 
1 & \text{if } x = y \\
0 & \text{otherwise}
\end{cases}
\]

Available since 2.0

\[
\text{int } \textbf{operator\textasciixor}(\text{int } x, \text{ int } y)
\]

\[
\text{int } \textbf{operator\textasciixor}(\text{real } x, \text{ real } y)
\]
Return 1 if \(x\) is not equal to \(y\) and 0 otherwise.

\[
\text{operator\textasciixor} (x, y) = \begin{cases} 
1 & \text{if } x \neq y \\
0 & \text{otherwise}
\end{cases}
\]

Available since 2.0

**Boolean operators**

Boolean operators return either 0 for false or 1 for true. Inputs may be any real or integer values, with non-zero values being treated as true and zero values treated as false. These operators have the usual precedences, with negation (not) binding the most tightly, conjunction the next and disjunction the weakest; all of the operators bind more tightly than the comparisons. Thus an expression such as \(!a \&\& b\)
is interpreted as \((!a) \&\& b\), and \(a < b \mid\mid c >= d \&\& e \neq f\) as \((a < b) \mid\mid ((c >= d) \&\& (e \neq f)))\).

**int operator!(int x)**

Return 1 if \(x\) is zero and 0 otherwise.

\[
operator!(x) = \begin{cases} 
0 & \text{if } x \neq 0 \\
1 & \text{if } x = 0
\end{cases}
\]

*Available since 2.0*

**int operator!(real x)**

Return 1 if \(x\) is zero and 0 otherwise.

\[
operator!(x) = \begin{cases} 
0 & \text{if } x \neq 0.0 \\
1 & \text{if } x = 0.0
\end{cases}
\]

*deprecated*; - use `operator==` instead.

*Available since 2.0, deprecated in 2.31*

**int operator&&(int x, int y)**

Return 1 if \(x\) is unequal to 0 and \(y\) is unequal to 0.

\[
operator&&(x, y) = \begin{cases} 
1 & \text{if } x \neq 0 \text{ and } y \neq 0 \\
0 & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

**int operator&&(real x, real y)**

Return 1 if \(x\) is unequal to 0.0 and \(y\) is unequal to 0.0.

\[
operator&&(x, y) = \begin{cases} 
1 & \text{if } x \neq 0.0 \text{ and } y \neq 0.0 \\
0 & \text{otherwise}
\end{cases}
\]

*deprecated*

*Available since 2.0, deprecated in 2.31*

**int operator||(int x, int y)**

Return 1 if \(x\) is unequal to 0 or \(y\) is unequal to 0.

\[
operator||(x, y) = \begin{cases} 
1 & \text{if } x \neq 0 \text{ or } y \neq 0 \\
0 & \text{otherwise}
\end{cases}
\]
3.5. LOGICAL FUNCTIONS

Available since 2.0

```c
int operator||(real x, real y)
```
Return 1 if x is unequal to 0.0 or y is unequal to 0.0.

\[
\text{operator} \mathbin{||} (x, y) = \begin{cases} 
1 & \text{if } x \neq 0.0 \text{ or } y \neq 0.0 \\
0 & \text{otherwise}
\end{cases}
\]

deprecated

Available since 2.0, deprecated in 2.31

**Boolean operator short circuiting**

Like in C++, the boolean operators && and || and are implemented to short circuit directly to a return value after evaluating the first argument if it is sufficient to resolve the result. In evaluating `a || b`, if `a` evaluates to a value other than zero, the expression returns the value 1 without evaluating the expression `b`. Similarly, evaluating `a && b` first evaluates `a`, and if the result is zero, returns 0 without evaluating `b`.

**Logical functions**

The logical functions introduce conditional behavior functionally and are primarily provided for compatibility with BUGS and JAGS.

```c
real step(real x)
```
Return 1 if x is positive and 0 otherwise.

\[
\text{step}(x) = \begin{cases} 
0 & \text{if } x < 0 \\
1 & \text{otherwise}
\end{cases}
\]

**Warning:** `int_step(0)` and `int_step(NaN)` return 0 whereas `step(0)` and `step(NaN)` return 1.

The step function is often used in BUGS to perform conditional operations. For instance, `step(a-b)` evaluates to 1 if `a` is greater than `b` and evaluates to 0 otherwise. `step` is a step-like functions; see the warning in section step functions applied to expressions dependent on parameters.

Available since 2.0

```c
int is_inf(real x)
```
Return 1 if x is infinite (positive or negative) and 0 otherwise.

Available since 2.5
int is_nan(real x)
Return 1 if x is NaN and 0 otherwise.
Available since 2.5

Care must be taken because both of these indicator functions are step-like and thus can cause discontinuities in gradients when applied to parameters; see section step-like functions for details.

3.6. Real-valued arithmetic operators

The arithmetic operators are presented using C++ notation. For instance operator+(x, y) refers to the binary addition operator and operator-(x) to the unary negation operator. In Stan programs, these are written using the usual infix and prefix notations as \( x + y \) and \(-x\), respectively.

**Binary infix operators**

```cpp
real operator+(real x, real y)
Return the sum of x and y.
\[(x + y) = \text{operator+}(x, y) = x + y\]
```

Available since 2.0

```cpp
real operator-(real x, real y)
Return the difference between x and y.
\[(x - y) = \text{operator-}(x, y) = x - y\]
```

Available since 2.0

```cpp
real operator*(real x, real y)
Return the product of x and y.
\[(x \cdot y) = \text{operator*}(x, y) = xy\]
```

Available since 2.0

```cpp
real operator/(real x, real y)
Return the quotient of x and y.
\[(x/y) = \text{operator/}(x, y) = \frac{x}{y}\]
```
3.7. **STEP-LIKE FUNCTIONS**

*Available since 2.0*

```
real operator^(real x, real y)
```

Return \(x\) raised to the power of \(y\).

\[(x^y) = \text{operator}^\wedge(x, y) = x^y\]

*Available since 2.5*

**Unary prefix operators**

```
real operator-(real x)
```

Return the negation of the subtrahend \(x\).

\[\text{operator-}(x) = (-x)\]

*Available since 2.0*

```
T operator-(T x)
```

Vectorized version of `operator-`. If \(T \ x\) is a (possibly nested) array of reals, \(-x\) is the same shape array where each individual number is negated.

*Available since 2.31*

```
real operator+(real x)
```

Return the value of \(x\).

\[\text{operator+}(x) = x\]

*Available since 2.0*

### 3.7. Step-like functions

**Warning:** These functions can seriously hinder sampling and optimization efficiency for gradient-based methods (e.g., NUTS, HMC, BFGS) if applied to parameters (including transformed parameters and local variables in the transformed parameters or model block). The problem is that they break gradients due to discontinuities coupled with zero gradients elsewhere. They do not hinder sampling when used in the data, transformed data, or generated quantities blocks.

**Absolute value functions**

```
T abs(T x)
```

The absolute value of \(x\).
This function works elementwise over containers such as vectors. Given a type \( T \) which is `real vector`, `row_vector`, `matrix`, or an array of those types, \( \text{abs} \) returns the same type where each element has had its absolute value taken.  

*Available since 2.0, vectorized in 2.30*

\[
\text{real } \text{fdim}(\text{real } x, \text{real } y) \\
\text{Return the positive difference between } x \text{ and } y, \text{ which is } x - y \text{ if } x \text{ is greater than } y \text{ and } 0 \text{ otherwise; see warning above.} \\
\text{fdim}(x, y) = \begin{cases} 
  x - y & \text{if } x \geq y \\
  0 & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

\[
\text{R } \text{fdim}(\text{T1 } x, \text{T2 } y) \\
\text{Vectorized implementation of the fdim function}
\]

*Available since 2.25*

**Bounds functions**

\[
\text{real } \text{fmin}(\text{real } x, \text{real } y) \\
\text{Return the minimum of } x \text{ and } y; \text{ see warning above.} \\
\text{fmin}(x, y) = \begin{cases} 
  x & \text{if } x \leq y \\
  y & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

\[
\text{R } \text{fmin}(\text{T1 } x, \text{T2 } y) \\
\text{Vectorized implementation of the fmin function}
\]

*Available since 2.25*

\[
\text{real } \text{fmax}(\text{real } x, \text{real } y) \\
\text{Return the maximum of } x \text{ and } y; \text{ see warning above.} \\
\text{fmax}(x, y) = \begin{cases} 
  x & \text{if } x \geq y \\
  y & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

\[
\text{R } \text{fmax}(\text{T1 } x, \text{T2 } y) \\
\text{Vectorized implementation of the fmax function}
\]

*Available since 2.25*
3.7. STEP-LIKE FUNCTIONS

**Arithmetic functions**

real \( \text{fmod}(\text{real } x, \text{real } y) \)

Return the real value remainder after dividing \( x \) by \( y \); see warning above.

\[
fmod(x, y) = x - \left\lfloor \frac{x}{y} \right\rfloor y
\]

The operator \( \lfloor u \rfloor \) is the floor operation; see below.

*Available since 2.0*

\[ \text{R fmod}(\text{T1 } x, \text{ T2 } y) \]

Vectorized implementation of the \( \text{fmod} \) function

*Available since 2.25*

**Rounding functions**

**Warning:** Rounding functions convert real values to integers. Because the output is an integer, any gradient information resulting from functions applied to the integer is not passed to the real value it was derived from. With MCMC sampling using HMC or NUTS, the MCMC acceptance procedure will correct for any error due to poor gradient calculations, but the result is likely to be reduced acceptance probabilities and less efficient sampling.

The rounding functions cannot be used as indices to arrays because they return real values. Stan may introduce integer-valued versions of these in the future, but as of now, there is no good workaround.

\[ \text{R floor}(\text{T } x) \]

The floor of \( x \), which is the largest integer less than or equal to \( x \), converted to a real value; see warning at start of section step-like functions

*Available since 2.0, vectorized in 2.13*

\[ \text{R ceil}(\text{T } x) \]

The ceiling of \( x \), which is the smallest integer greater than or equal to \( x \), converted to a real value; see warning at start of section step-like functions

*Available since 2.0, vectorized in 2.13*

\[ \text{R round}(\text{T } x) \]

The nearest integer to \( x \), converted to a real value; see warning at start of section step-like functions

*Available since 2.0, vectorized in 2.13*

\[ \text{R trunc}(\text{T } x) \]

The integer nearest to but no larger in magnitude than \( x \), converted to a double
value; see warning at start of section step-like functions
Available since 2.0, vectorized in 2.13

3.8. Power and logarithm functions

\textbf{R \texttt{sqrt}(T \: x)}

The square root of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{cbrt}(T \: x)}

The cube root of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{square}(T \: x)}

The square of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{exp}(T \: x)}

The natural exponential of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{exp2}(T \: x)}

The base-2 exponential of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{log}(T \: x)}

The natural logarithm of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{log2}(T \: x)}

The base-2 logarithm of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{R \texttt{log10}(T \: x)}

The base-10 logarithm of \( x \)
Available since 2.0, vectorized in 2.13

\textbf{real \texttt{pow}(real \: x, \: real \: y)}

Return \( x \) raised to the power of \( y \).

\[ \text{pow}(x, y) = x^y \]

Available since 2.0
3.9. **TRIGONOMETRIC FUNCTIONS**

\( \text{R pow}(T1 \ x, T2 \ y) \)
Vectorized implementation of the \text{pow} function
\textit{Available since 2.25}

\( \text{R inv}(T \ x) \)
The inverse of \( x \)
\textit{Available since 2.0, vectorized in 2.13}

\( \text{R inv_sqrt}(T \ x) \)
The inverse of the square root of \( x \)
\textit{Available since 2.0, vectorized in 2.13}

\( \text{R inv_square}(T \ x) \)
The inverse of the square of \( x \)
\textit{Available since 2.0, vectorized in 2.13}

### 3.9. Trigonometric functions

\text{real} \text{hypot}(\text{real} \ x, \text{real} \ y)
Return the length of the hypotenuse of a right triangle with sides of length \( x \) and \( y \).

\[
\text{hypot}(x, y) = \begin{cases} 
\sqrt{x^2 + y^2} & \text{if } x, y \geq 0 \\
\text{NaN} & \text{otherwise}
\end{cases}
\]

\textit{Available since 2.0}

\( \text{R hypot}(T1 \ x, T2 \ y) \)
Vectorized implementation of the \text{hypot} function
\textit{Available since 2.25}

\( \text{R cos}(T \ x) \)
The cosine of the angle \( x \) (in radians)
\textit{Available since 2.0, vectorized in 2.13}

\( \text{R sin}(T \ x) \)
The sine of the angle \( x \) (in radians)
\textit{Available since 2.0, vectorized in 2.13}

\( \text{R tan}(T \ x) \)
The tangent of the angle \( x \) (in radians)
\textit{Available since 2.0, vectorized in 2.13}

\( \text{R acos}(T \ x) \)
The principal arc (inverse) cosine (in radians) of \( x \)
Available since 2.0, vectorized in 2.13

\texttt{R asin(T x)}

The principal arc (inverse) sine (in radians) of x

\textit{Available since 2.0}

\texttt{R atan(T x)}

The principal arc (inverse) tangent (in radians) of x, with values from $-\pi/2$ to $\pi/2$

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R atan2(T y, T x)}

Return the principal arc (inverse) tangent (in radians) of y divided by x,

$$\text{atan2}(y, x) = \arctan\left(\frac{y}{x}\right)$$

\textit{Available since 2.0, vectorized in 2.34}

### 3.10. Hyperbolic trigonometric functions

\texttt{R cosh(T x)}

The hyperbolic cosine of x (in radians)

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R sinh(T x)}

The hyperbolic sine of x (in radians)

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R tanh(T x)}

The hyperbolic tangent of x (in radians)

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R acosh(T x)}

The inverse hyperbolic cosine (in radians)

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R asinh(T x)}

The inverse hyperbolic cosine (in radians)

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R atanh(T x)}

The inverse hyperbolic tangent (in radians) of x

\textit{Available since 2.0, vectorized in 2.13}
3.11. Link functions

The following functions are commonly used as link functions in generalized linear models. The function \( \Phi \) is also commonly used as a link function (see section probability-related functions).

- **R logit(T x)**
  The log odds, or logit, function applied to \( x \)
  Available since 2.0, vectorized in 2.13

- **R inv_logit(T x)**
  The logistic sigmoid function applied to \( x \)
  Available since 2.0, vectorized in 2.13

- **R inv_cloglog(T x)**
  The inverse of the complementary log-log function applied to \( x \)
  Available since 2.0, vectorized in 2.13

3.12. Probability-related functions

**Normal cumulative distribution functions**

The error function \( \text{erf} \) is related to the standard normal cumulative distribution function \( \Phi \) by scaling. See section normal distribution for the general normal cumulative distribution function (and its complement).

- **R erf(T x)**
  The error function, also known as the Gauss error function, of \( x \)
  Available since 2.0, vectorized in 2.13

- **R erfc(T x)**
  The complementary error function of \( x \)
  Available since 2.0, vectorized in 2.13

- **R inv_erfc(T x)**
  The inverse of the complementary error function of \( x \)
  Available since 2.29, vectorized in 2.29

- **R Phi(T x)**
  The standard normal cumulative distribution function of \( x \)
  Available since 2.0, vectorized in 2.13

- **R inv_Phi(T x)**
  Return the value of the inverse standard normal cdf \( \Phi^{-1} \) at the specified quantile \( x \).
  The details of the algorithm can be found in (Wichura 1988). Quantile arguments
below 1e-16 are untested; quantiles above 0.999999999 result in increasingly large errors.

Available since 2.0, vectorized in 2.13

\texttt{R \Phi_{\text{approx}}(T \ x)}

The fast approximation of the unit (may replace \Phi for probit regression with maximum absolute error of 0.00014, see (Bowling et al. 2009) for details)

Available since 2.0, vectorized in 2.13

**Other probability-related functions**

\texttt{real binary_log_loss(int y, real y_hat)}

Return the log loss function for predicting \( \hat{y} \in [0, 1] \) for boolean outcome \( y \in \{0, 1\} \).

\[
\text{binary_log_loss}(y, \hat{y}) = \begin{cases} 
-\log \hat{y} & \text{if } y = 1 \\
-\log(1 - \hat{y}) & \text{otherwise}
\end{cases}
\]

Available since 2.0

\texttt{R binary_log_loss(T1 x, T2 y)}

Vectorized implementation of the \texttt{binary_log_loss} function

Available since 2.25

\texttt{real owens_t(real h, real a)}

Return the Owen’s T function for the probability of the event \( X > h \) and \( 0 < Y < aX \) where \( X \) and \( Y \) are independent standard normal random variables.

\[
\text{owens_t}(h, a) = \frac{1}{2\pi} \int_{0}^{a} \frac{\exp(-\frac{1}{2}h^2(1+x^2))}{1+x^2} dx
\]

Available since 2.25

\texttt{R owens_t(T1 x, T2 y)}

Vectorized implementation of the \texttt{owens_t} function

Available since 2.25

**3.13. Combinatorial functions**

\texttt{real beta(real alpha, real beta)}

Return the beta function applied to alpha and beta. The beta function, \( B(\alpha, \beta) \), computes the normalizing constant for the beta distribution, and is defined for \( \alpha > 0 \) and \( \beta > 0 \). See section appendix for definition of \( B(\alpha, \beta) \).

Available since 2.25
3.13. COMBINATORIAL FUNCTIONS

\texttt{R \textbf{beta}(T1 \ x, T2 \ y)}

Vectorized implementation of the beta function

\textit{Available since 2.25}

\texttt{R \textbf{inc\_beta}(real \ alpha, real \ beta, real \ x)}

Return the regularized incomplete beta function up to x applied to alpha and beta. See section appendix for a definition.

\textit{Available since 2.10}

\texttt{R \textbf{inv\_inc\_beta}(real \ alpha, real \ beta, real \ p)}

Return the inverse of the regularized incomplete beta function. The return value x is the value that solves \( p = \text{inc\_beta}(\alpha, \ beta, x) \). See section appendix for a definition of the \textbf{inc\_beta}.

\textit{Available since 2.30}

\texttt{R \textbf{lbeta}(real \ alpha, real \ beta)}

Return the natural logarithm of the beta function applied to alpha and beta. The beta function, \( B(\alpha, \beta) \), computes the normalizing constant for the beta distribution, and is defined for \( \alpha > 0 \) and \( \beta > 0 \).

\[ \text{lbeta}(\alpha, \beta) = \log \Gamma(a) + \log \Gamma(b) - \log \Gamma(a + b) \]

See section appendix for definition of \( B(\alpha, \beta) \).

\textit{Available since 2.0}

\texttt{R \textbf{lbeta}(T1 \ x, T2 \ y)}

Vectorized implementation of the \textbf{lbeta} function

\textit{Available since 2.25}

\texttt{R \textbf{tgamma}(T \ x)}

The gamma function applied to x. The gamma function is the generalization of the factorial function to continuous variables, defined so that \( \Gamma(n + 1) = n! \). See for a full definition of \( \Gamma(x) \). The function is defined for positive numbers and non-integral negative numbers.

\textit{Available since 2.0, vectorized in 2.13}

\texttt{R \textbf{lgamma}(T \ x)}

The natural logarithm of the gamma function applied to x,

\textit{Available since 2.0, vectorized in 2.15}

\texttt{R \textbf{digamma}(T \ x)}

The digamma function applied to x. The digamma function is the derivative of the natural logarithm of the Gamma function. The function is defined for positive
numbers and non-integral negative numbers
Available since 2.0, vectorized in 2.13

R `trigamma(T x)`
The trigamma function applied to x. The trigamma function is the second derivative of the natural logarithm of the Gamma function
Available since 2.0, vectorized in 2.13

real `lmgamma(int n, real x)`
Return the natural logarithm of the multivariate gamma function \( \Gamma_n \) with \( n \) dimensions applied to x.

\[
lmgamma(n, x) = \begin{cases} 
\frac{n(n-1)}{4} \log \pi + \sum_{j=1}^{n} \log \Gamma \left( x + \frac{1-j}{2} \right) & \text{if } x \not\in \{\ldots, -3, -2, -1, 0\} \\
\text{error} & \text{otherwise}
\end{cases}
\]
Available since 2.0

R `lmgamma(T1 x, T2 y)`
Vectorized implementation of the `lmgamma` function
Available since 2.25

real `gamma_p(real a, real z)`
Return the normalized lower incomplete gamma function of \( a \) and \( z \) defined for positive \( a \) and nonnegative \( z \).

\[
gamma_p(a, z) = \begin{cases} 
\frac{1}{\Gamma(a)} \int_0^z t^{a-1} e^{-t} dt & \text{if } a > 0, z \geq 0 \\
\text{error} & \text{otherwise}
\end{cases}
\]
Available since 2.0

R `gamma_p(T1 x, T2 y)`
Vectorized implementation of the `gamma_p` function
Available since 2.25

real `gamma_q(real a, real z)`
Return the normalized upper incomplete gamma function of \( a \) and \( z \) defined for positive \( a \) and nonnegative \( z \).

\[
gamma_q(a, z) = \begin{cases} 
\frac{1}{\Gamma(a)} \int_z^\infty t^{a-1} e^{-t} dt & \text{if } a > 0, z \geq 0 \\
\text{error} & \text{otherwise}
\end{cases}
\]

Available since 2.0

\[ R \text{ gamma}_q(T1 \ x, T2 \ y) \]
Vectorized implementation of the gamma_q function

Available since 2.25

\[ \text{int choose}(\text{int } x, \text{int } y) \]
Return the binomial coefficient of \( x \) and \( y \). For non-negative integer inputs, the binomial coefficient function is written as \( \binom{x}{y} \) and pronounced “\( x \) choose \( y \).” In its the antilog of the \( lchoose \) function but returns an integer rather than a real number with no non-zero decimal places. For \( 0 \leq y \leq x \), the binomial coefficient function can be defined via the factorial function

\[
\text{choose}(x, y) = \frac{x!}{(y!)(x-y)!}.
\]

Available since 2.14

\[ R \text{ choose}(T1 \ x, \ T2 \ y) \]
Vectorized implementation of the choose function

Available since 2.25

\[ \text{real bessel_first_kind}(\text{int } v, \text{real } x) \]
Return the Bessel function of the first kind with order \( v \) applied to \( x \).

\[
\text{bessel_first_kind}(v, x) = J_v(x),
\]

where

\[
J_v(x) = \left(\frac{1}{2}x\right)^v \sum_{k=0}^{\infty} \frac{(-\frac{1}{4}x^2)^k}{k! \Gamma(v+k+1)}
\]

Available since 2.5

\[ R \text{ bessel_first_kind}(T1 \ x, \ T2 \ y) \]
Vectorized implementation of the bessel_first_kind function

Available since 2.25

\[ \text{real bessel_second_kind}(\text{int } v, \text{real } x) \]
Return the Bessel function of the second kind with order \( v \) applied to \( x \) defined for positive \( x \) and \( v \). For \( x, v > 0 \),

\[
\text{bessel_second_kind}(v, x) = \begin{cases} 
Y_v(x) & \text{if } x > 0 \\
\text{error} & \text{otherwise}
\end{cases}
\]
where

\[ Y_v(x) = \frac{J_v(x) \cos(v\pi) - J_{-v}(x)}{\sin(v\pi)} \]

Available since 2.5

R `bessel_second_kind`(T1 x, T2 y)
Vectorized implementation of the `bessel_second_kind` function

Available since 2.25

real `modified_bessel_first_kind`(int v, real z)
Return the modified Bessel function of the first kind with order v applied to z defined for all z and integer v.

\[ \text{modified\_bessel\_first\_kind}(v, z) = I_v(z) \]

where

\[ I_v(z) = \left( \frac{1}{2}z \right)^v \sum_{k=0}^{\infty} \frac{\left( \frac{1}{4}z^2 \right)^k}{k! \Gamma(v + k + 1)} \]

Available since 2.1

R `modified_bessel_first_kind`(T1 x, T2 y)
Vectorized implementation of the `modified\_bessel\_first\_kind` function

Available since 2.25

real `log_modified_bessel_first_kind`(real v, real z)
Return the log of the modified Bessel function of the first kind. v does not have to be an integer.

Available since 2.26

R `log_modified_bessel_first_kind`(T1 x, T2 y)
Vectorized implementation of the `log\_modified\_bessel\_first\_kind` function

Available since 2.26

real `modified_bessel_second_kind`(int v, real z)
Return the modified Bessel function of the second kind with order v applied to z defined for positive z and integer v.

\[ \text{modified\_bessel\_second\_kind}(v, z) = \begin{cases} K_v(z) & \text{if } z > 0 \\ \text{error} & \text{if } z \leq 0 \end{cases} \]
where

\[ K_v(z) = \frac{\pi}{2} \cdot \frac{I_{-v}(z) - I_v(z)}{\sin(v\pi)} \]

Available since 2.1

R **modified_bessel_second_kind**(T1 x, T2 y)
Vectorized implementation of the `modified_bessel_second_kind` function

Available since 2.25

R **falling_factorial**(real x, real n)
Return the falling factorial of x with power n defined for positive x and real n.

\[
\text{falling_factorial}(x, n) = \begin{cases} 
(x)_n & \text{if } x > 0 \\
\text{error} & \text{if } x \leq 0
\end{cases}
\]

where

\[
(x)_n = \frac{\Gamma(x + 1)}{\Gamma(x - n + 1)}
\]

Available since 2.0

R **lchoose**(real x, real y)
Return the natural logarithm of the generalized binomial coefficient of x and y. For non-negative integer inputs, the binomial coefficient function is written as \( \binom{x}{y} \) and pronounced “x choose y.” This function generalizes to real numbers using the gamma function. For \( 0 \leq y \leq x \),

\[
\text{binomial_coefficient_log}(x, y) = \log \Gamma(x + 1) - \log \Gamma(y + 1) - \log \Gamma(x - y + 1).
\]

Available since 2.10

R **lchoose**(T1 x, T2 y)
Vectorized implementation of the `lchoose` function

Available since 2.29

R **log_falling_factorial**(real x, real n)
Return the log of the falling factorial of x with power n defined for positive x and
real n.

\[
\text{log\_falling\_factorial}(x, n) = \begin{cases} 
\log(x)_n & \text{if } x > 0 \\
\text{error} & \text{if } x \leq 0 
\end{cases}
\]

Available since 2.0

real \textbf{rising\_factorial}(\text{real } x, \text{int } n)

Return the rising factorial of \(x\) with power \(n\) defined for positive \(x\) and integer \(n\).

\[
\text{rising\_factorial}(x, n) = \begin{cases} 
x^{(n)} & \text{if } x > 0 \\
\text{error} & \text{if } x \leq 0 
\end{cases}
\]

where

\[
x^{(n)} = \frac{\Gamma(x + n)}{\Gamma(x)}
\]

Available since 2.20

\textbf{R} \textbf{rising\_factorial}(\text{T1 } x, \text{T2 } y)

Vectorized implementation of the \text{rising\_factorial} function

Available since 2.25

real \textbf{log\_rising\_factorial}(\text{real } x, \text{real } n)

Return the log of the rising factorial of \(x\) with power \(n\) defined for positive \(x\) and real \(n\).

\[
\text{log\_rising\_factorial}(x, n) = \begin{cases} 
\log x^{(n)} & \text{if } x > 0 \\
\text{error} & \text{if } x \leq 0 
\end{cases}
\]

Available since 2.0

\textbf{R} \textbf{log\_rising\_factorial}(\text{T1 } x, \text{T2 } y)

Vectorized implementation of the \text{log\_rising\_factorial} function

Available since 2.25

3.14. Composed functions

The functions in this section are equivalent in theory to combinations of other functions. In practice, they are implemented to be more efficient and more numerically stable than defining them directly using more basic Stan functions.

\textbf{R} \textbf{expm1}(\text{T } x)

The natural exponential of \(x\) minus 1

Available since 2.0, vectorized in 2.13
3.14. COMPOSED FUNCTIONS

**real fma(real x, real y, real z)**
Return z plus the result of x multiplied by y.

\[ \text{fma}(x, y, z) = (x \times y) + z \]

*Available since 2.0*

**real ldexp(real x, int y)**
Return the product of x and two raised to the y power.

\[ \text{ldexp}(x, y) = x \times 2^y \]

*Available since 2.25*

**R ldexp(T1 x, T2 y)**
Vectorized implementation of the ldexp function
*Available since 2.25*

**real lmultiply(real x, real y)**
Return the product of x and the natural logarithm of y.

\[ \text{lmultiply}(x, y) = \begin{cases} 0 & \text{if } x = y = 0 \\ x \log y & \text{if } x, y \neq 0 \\ \text{NaN} & \text{otherwise} \end{cases} \]

*Available since 2.10*

**R lmultiply(T1 x, T2 y)**
Vectorized implementation of the lmultiply function
*Available since 2.25*

**R log1p(T x)**
The natural logarithm of 1 plus x
*Available since 2.0, vectorized in 2.13*

**R log1m(T x)**
The natural logarithm of 1 minus x
*Available since 2.0, vectorized in 2.13*

**R log1p_exp(T x)**
The natural logarithm of one plus the natural exponentiation of x
*Available since 2.0, vectorized in 2.13*
**R log1m_exp(T x)**
The logarithm of one minus the natural exponentiation of x  
*Available since 2.0, vectorized in 2.13*

**real log_diff_exp(real x, real y)**
Return the natural logarithm of the difference of the natural exponentiation of x and the natural exponentiation of y.

\[
\log\text{diff}\_exp(x, y) = \begin{cases} 
\log(\exp(x) - \exp(y)) & \text{if } x > y \\
\text{NaN} & \text{otherwise}
\end{cases}
\]

*Available since 2.0*

**R log_diff_exp(T1 x, T2 y)**
Vectorized implementation of the log_diff_exp function  
*Available since 2.25*

**real log_mix(real theta, real lp1, real lp2)**
Return the log mixture of the log densities lp1 and lp2 with mixing proportion theta, defined by

\[
\log\text{mix}(\theta, \lambda_1, \lambda_2) = \log(\theta \exp(\lambda_1) + (1 - \theta) \exp(\lambda_2)) = \log\text{sum}\_exp(\log(\theta) + \lambda_1, \log(1 - \theta) + \lambda_2).
\]

*Available since 2.6*

**R log_mix(T1 theta, T2 lp1, T3 lp2)**
Vectorized implementation of the log_mix function  
*Available since 2.26*

**R log_sum_exp(T1 x, T2 y)**
Return the natural logarithm of the sum of the natural exponentiation of x and the natural exponentiation of y.

\[
\log\text{sum}\_exp(x, y) = \log(\exp(x) + \exp(y))
\]

*Available since 2.0, vectorized in 2.33*

**R log_inv_logit(T x)**
The natural logarithm of the inverse logit function of x  
*Available since 2.0, vectorized in 2.13*
\texttt{R log_inv_logit_diff(T1 x, T2 y)}
The natural logarithm of the difference of the inverse logit function of \(x\) and the inverse logit function of \(y\)
\textit{Available since 2.25}

\texttt{R log1m_inv_logit(T x)}
The natural logarithm of 1 minus the inverse logit function of \(x\)
\textit{Available since 2.0, vectorized in 2.13}

3.15. Special functions

\texttt{R lambert_w0(T x)}
Implementation of the \(W_0\) branch of the Lambert \(W\) function, i.e., solution to the function \(W_0(x) \exp^{W_0(x)} = x\)
\textit{Available since 2.25}

\texttt{R lambert_wm1(T x)}
Implementation of the \(W_{-1}\) branch of the Lambert \(W\) function, i.e., solution to the function \(W_{-1}(x) \exp^{W_{-1}(x)} = x\)
\textit{Available since 2.25}
4. Complex-Valued Basic Functions

This chapter describes built-in functions that operate on complex numbers, either as an argument type or a return type. This includes the arithmetic operators generalized to complex numbers.

4.1. Complex assignment and promotion

Just as integers may be assigned to real variables, real variables may be assigned to complex numbers, with the result being a zero imaginary component.

```plaintext
int n = 5;  // n = 5
real x = a; // x = 5.0
complex z1 = n; // z = 5.0 + 0.0i
complex z2 = x; // z = 5.0 + 0.0i
```

**Complex function arguments**

Function arguments of type `int` or `real` may be promoted to type `complex`. The complex version of functions in this chapter are only used if one of the arguments is complex. For example, if `z` is complex, then `pow(z, 2)` will call the complex version of the power function and the integer 2 will be promoted to a complex number with a real component of 2 and an imaginary component of 0. The same goes for binary operators like addition and subtraction, where `z + 2` will be legal and produce a complex result. Functions such as `arg` and `conj` that are only available for complex numbers can accept integer or real arguments, promoting them to `complex` before applying the function.

4.2. Complex constructors and accessors

**Complex constructors**

Variables and constants of type `complex` are constructed from zero, one, or two real numbers.

```plaintext
complex z1 = to_complex();   // z1 = 0.0 + 0.0i
real re = -2.9;
complex z2 = to_complex(re); // z2 = -2.9 + 0.0i
real im = 1.3;
complex z3 = to_complex(re, im); // z3 = -2.9 + 1.3i
```
4.3. COMPLEX ARITHMETIC OPERATORS

complex to_complex()
Return complex number with real part 0.0 and imaginary part 0.0.
Available since 2.28

complex to_complex(real re)
Return complex number with real part re and imaginary part 0.0.
Available since 2.28

complex to_complex(real re, real im)
Return complex number with real part re and imaginary part im.
Available since 2.28

Z to_complex(T1 re, T2 im)
Vectorized implementation of the to_complex function.

T1 and T2 can either be real containers of the same size, or a real container and a real, in which case the real value is used for the corresponding component in all elements of the output.
Available since 2.30

Complex accessors
Given a complex number, its real and imaginary parts can be extracted with the following functions.

real get_real(complex z)
Return the real part of the complex number z.
Available since 2.28

real get_imag(complex z)
Return the imaginary part of the complex number z.
Available since 2.28

4.3. Complex arithmetic operators

The arithmetic operators have the same precedence for complex and real arguments. The complex form of an operator will be selected if at least one of its argument is of type complex. If there are two arguments and only one is of type complex, then the other will be promoted to type complex before performing the operation.

Unary operators
complex operator+(complex z)
Return the complex argument z,

\[ +z = z. \]
Available since 2.28

**complex operator-**(complex z)

Return the negation of the complex argument z, which for \( z = x + yi \) is

\[
-z = -x - yi.
\]

Available since 2.28

**T operator-**(T x)

Vectorized version of `operator-`. If T x is a (possibly nested) array of complex numbers, \(-x\) is the same shape array where each individual value is negated.

*Available since 2.31*

**Binary operators**

**complex operator+**(complex x, complex y)

Return the sum of x and y,

\[
(x + y) = \text{operator+}(x, y) = x + y.
\]

Available since 2.28

**complex operator-**(complex x, complex y)

Return the difference between x and y,

\[
(x - y) = \text{operator-}(x, y) = x - y.
\]

Available since 2.28

**complex operator***(complex x, complex y)

Return the product of x and y,

\[
(x \times y) = \text{operator*}(x, y) = x \times y.
\]

Available since 2.28

**complex operator/**(complex x, complex y)

Return the quotient of x and y,

\[
(x/y) = \text{operator/}(x, y) = \frac{x}{y}
\]
4.4. COMPLEX COMPARISON OPERATORS

Available since 2.28

complex operatorˆ(complex x, complex y)
Return x raised to the power of y,

\((x^y) = \text{operator}^\wedge(x, y) = \exp(y \log(x))\).

Available since 2.28

4.4. Complex comparison operators

Complex numbers are equal if and only if both their real and imaginary components are equal. That is, the conditional

\(z1 == z2\)

is equivalent to

\(\text{get_real}(z1) == \text{get_real}(z2) && \text{get_imag}(z1) == \text{get_imag}(z2)\)

As with other complex functions, if one of the arguments is of type real or int, it will be promoted to type complex before comparison. For example, if z is of type complex, then \(z == 0\) will be true if z has real component equal to 0.0 and complex component equal to 0.0.

Warning: As with real values, it is usually a mistake to compare complex numbers for equality because their parts are implemented using floating-point arithmetic, which suffers from precision errors, rendering algebraically equivalent expressions not equal after evaluation.

int operator==(complex x, complex y)
Return 1 if x is equal to y and 0 otherwise,

\((x==y) = \text{operator}==(x, y) = \begin{cases} 1 & \text{if } x = y, \text{ and} \\ 0 & \text{otherwise.} \end{cases}\)

Available since 2.28

int operator!=(complex x, complex y)
Return 1 if x is not equal to y and 0 otherwise,

\((x!=y) = \text{operator}!=(x, y) = \begin{cases} 1 & \text{if } x \neq y, \text{ and} \\ 0 & \text{otherwise.} \end{cases}\)
4.5. Complex (compound) assignment operators

The assignment operator only serves as a component in the assignment statement and is thus not technically a function in the Stan language. With that caveat, it is documented here for completeness.

Assignment of complex numbers works elementwise. If an expression of type int or real is assigned to a complex number, it will be promoted before assignment as if calling `to_complex()`, so that the imaginary component is 0.0.

```cpp
void operator=(complex x, complex y)
y = x; assigns a (copy of) the value of y to x.
```

```cpp
void operator+=(complex x, complex y)
x += y; is equivalent to x = x + y;
```

```cpp
void operator-=(complex x, complex y)
x -= y; is equivalent to x = x - y;
```

```cpp
void operator*=(complex x, complex y)
x *= y; is equivalent to x = x * y;
```

```cpp
void operator/=(complex x, complex y)
x /= y; is equivalent to x = x / y;
```

4.6. Complex special functions

The following functions are specific to complex numbers other than absolute value, which has a specific meaning for complex numbers.

```cpp
real abs(complex z)
```

Return the absolute value of z, also known as the modulus or magnitude, which for \(z = x + yi\) is

\[
abs(z) = \sqrt{x^2 + y^2}.
\]

This function works elementwise over containers, returning the same shape and
kind of the input container but holding reals. For example, a `complex_vector[n]` input will return a `vector[n]` output, with each element transformed by the above equation.

\[ \text{Available since 2.28, vectorized in 2.30} \]

**real** \texttt{arg(complex z)}

Return the phase angle (in radians) of \( z \), which for \( z = x + yi \) is

\[ \text{arg}(z) = \text{atan2}(y, x) = \text{atan}(y/x). \]

\[ \text{Available since 2.28} \]

**real** \texttt{norm(complex z)}

Return the Euclidean norm of \( z \), which is its absolute value squared, and which for \( z = x + yi \) is

\[ \text{norm}(z) = \text{abs}(z)^2 = x^2 + y^2. \]

\[ \text{Available since 2.28} \]

**complex** \texttt{conj(complex z)}

Return the complex conjugate of \( z \), which negates the imaginary component, so that if \( z = x + yi \),

\[ \text{conj}(z) = x - yi. \]

\[ \text{Available since 2.28} \]

**Z conj(Z z)**

Vectorized version of \texttt{conj}. This will apply the \texttt{conj} function to each element of a complex array, vector, or matrix.

\[ \text{Available since 2.31} \]

**complex** \texttt{proj(complex z)}

Return the projection of \( z \) onto the Riemann sphere, which for \( z = x + yi \) is

\[ \text{proj}(z) = \begin{cases} z & \text{if } z \text{ is finite, and} \\ 0 + \text{sign}(y)i & \text{otherwise,} \end{cases} \]

where \( \text{sign}(y) \) is -1 if \( y \) is negative and 1 otherwise.

\[ \text{Available since 2.28} \]

**complex** \texttt{polar(real r, real theta)}

Return the complex number with magnitude (absolute value) \( r \) and phase angle
4.7. Complex exponential and power functions

The exponential, log, and power functions may be supplied with complex arguments with specialized meanings that generalize their real counterparts. These versions are only called when the argument is complex.

complex \texttt{exp}(\text{complex } z)

Return the complex natural exponential of $z$, which for $z = x + yi$ is

$$
\exp z = \exp(x)\text{cis}(y) = \exp(x)(\cos(y) + i \sin(y)).
$$

\textit{Available since 2.28}

complex \texttt{log}(\text{complex } z)

Return the complex natural logarithm of $z$, which for $z = \text{polar}(r, \theta)$ is

$$
\log z = \log r + \theta i.
$$

\textit{Available since 2.28}

complex \texttt{log10}(\text{complex } z)

Return the complex common logarithm of $z$,

$$
\log_{10} z = \frac{\log z}{\log 10}.
$$

\textit{Available since 2.28}

complex \texttt{pow}(\text{complex } x, \text{complex } y)

Return $x$ raised to the power of $y$,

$$
pow(x, y) = \exp(y \log(x)).
$$

\textit{Available since 2.28}

\texttt{Z pow}(\text{T1 } x, \text{T2 } y)

Vectorized implementation of the \texttt{pow} function

\textit{Available since 2.30}
complex \( \text{sqrt}(\text{complex } x) \)
Return the complex square root of \( x \) with branch cut along the negative real axis. For finite inputs, the result will be in the right half-plane.
*Available since 2.28*

### 4.8. Complex trigonometric functions
The standard trigonometric functions are supported for complex numbers.

complex \( \text{cos}(\text{complex } z) \)
Return the complex cosine of \( z \), which is
\[
\cos(z) = \cosh(zi) = \frac{\exp(zi) + \exp(-zi)}{2}.
\]
*Available since 2.28*

complex \( \text{sin}(\text{complex } z) \)
Return the complex sine of \( z \),
\[
\sin(z) = -\sinh(zi) i = \frac{\exp(zi) - \exp(-zi)}{2i}.
\]
*Available since 2.28*

complex \( \text{tan}(\text{complex } z) \)
Return the complex tangent of \( z \),
\[
\tan(z) = -\tanh(zi) i = \frac{(\exp(-zi) - \exp(zi)) i}{\exp(-zi) + \exp(zi)}.
\]
*Available since 2.28*

complex \( \text{acos}(\text{complex } z) \)
Return the complex arc (inverse) cosine of \( z \),
\[
\text{acos}(z) = \frac{1}{2} \pi + \log(zi + \sqrt{1 - z^2}) i.
\]
*Available since 2.28*

complex \( \text{asin}(\text{complex } z) \)
Return the complex arc (inverse) sine of \( z \),
\[
\text{asin}(z) = -\log(zi + \sqrt{1 - z^2}) i.
\]
Available since 2.28

complex atan(complex z)
Return the complex arc (inverse) tangent of z,
\[
\tan^{-1}(z) = -\frac{1}{2} \left( \log(1 - z i) - \log(1 + z i) \right) i.
\]

Available since 2.28

### 4.9. Complex hyperbolic trigonometric functions

The standard hyperbolic trigonometric functions are supported for complex numbers.

complex cosh(complex z)
Return the complex hyperbolic cosine of z,
\[
\cosh(z) = \frac{\exp(z) + \exp(-z)}{2}.
\]

Available since 2.28

complex sinh(complex z)
Return the complex hyperbolic sine of z,
\[
\sinh(z) = \frac{\exp(z) - \exp(-z)}{2}.
\]

Available since 2.28

complex tanh(complex z)
Return the complex hyperbolic tangent of z,
\[
\tanh(z) = \frac{\sinh(z)}{\cosh(z)} = \frac{\exp(z) - \exp(-z)}{\exp(z) + \exp(-z)}.
\]

Available since 2.28

complex acosh(complex z)
Return the complex hyperbolic arc (inverse) cosine of z,
\[
\text{acosh}(z) = \log(z + \sqrt{(z + 1)(z - 1)})
\]
4.9. COMPLEX HYPERBOLIC TRIGONOMETRIC FUNCTIONS

Available since 2.28

complex \texttt{asinh}(\texttt{complex } z)

Return the complex hyperbolic arc (inverse) sine of \( z \),

\[
\text{asinh}(z) = \log(z + \sqrt{1 + z^2}).
\]

Available since 2.28

complex \texttt{atanh}(\texttt{complex } z)

Return the complex hyperbolic arc (inverse) tangent of \( z \),

\[
\text{atanh}(z) = \frac{\log(1 + z) - \log(1 - z)}{2}.
\]
5. Array Operations

5.1. Reductions

The following operations take arrays as input and produce single output values. The boundary values for size 0 arrays are the unit with respect to the combination operation (min, max, sum, or product).

**Minimum and maximum**

- **real min(array[] real x)**
  The minimum value in x, or $+\infty$ if x is size 0.
  
  *Available since 2.0*

- **int min(array[] int x)**
  The minimum value in x, or error if x is size 0.
  
  *Available since 2.0*

- **real max(array[] real x)**
  The maximum value in x, or $-\infty$ if x is size 0.
  
  *Available since 2.0*

- **int max(array[] int x)**
  The maximum value in x, or error if x is size 0.
  
  *Available since 2.0*

**Sum, product, and log sum of exp**

- **int sum(array[] int x)**
  The sum of the elements in x, or 0 if the array is empty.
  
  *Available since 2.1*

- **real sum(array[] real x)**
  The sum of the elements in x; see definition above.
  
  *Available since 2.0*

- **complex sum(array[] complex x)**
  The sum of the elements in x; see definition above.
  
  *Available since 2.30*

- **real prod(array[] real x)**
  The product of the elements in x, or 1 if x is size 0.
5.1. REDUCTIONS

Available since 2.0

real prod(array[] int x)
The product of the elements in x,

\[
\text{product}(x) = \begin{cases} 
\prod_{n=1}^{N} x_n & \text{if } N > 0 \\
1 & \text{if } N = 0 
\end{cases}
\]

Available since 2.0

real log_sum_exp(array[] real x)
The natural logarithm of the sum of the exponentials of the elements in x, or \(-\infty\) if the array is empty.

Available since 2.0

Sample mean, variance, and standard deviation
The sample mean, variance, and standard deviation are calculated in the usual way. For i.i.d. draws from a distribution of finite mean, the sample mean is an unbiased estimate of the mean of the distribution. Similarly, for i.i.d. draws from a distribution of finite variance, the sample variance is an unbiased estimate of the variance.\(^1\) The sample deviation is defined as the square root of the sample deviation, but is not unbiased.

real mean(array[] real x)
The sample mean of the elements in x. For an array \(x\) of size \(N > 0\),

\[
\text{mean}(x) = \bar{x} = \frac{1}{N} \sum_{n=1}^{N} x_n.
\]

It is an error to call the mean function with an array of size 0.

Available since 2.0

real variance(array[] real x)
The sample variance of the elements in x. For \(N > 0\),

\[
\text{variance}(x) = \begin{cases} 
\frac{1}{N-1} \sum_{n=1}^{N} (x_n - \bar{x})^2 & \text{if } N > 1 \\
0 & \text{if } N = 1 
\end{cases}
\]

It is an error to call the variance function with an array of size 0.

\(^1\)Dividing by \(N\) rather than \((N - 1)\) produces a maximum likelihood estimate of variance, which is biased to underestimate variance.
real `sd`(array[] real x)
The sample standard deviation of elements in x.

\[
\text{sd}(x) = \begin{cases} 
\sqrt{\text{variance}(x)} & \text{if } N > 1 \\
0 & \text{if } N = 0
\end{cases}
\]

It is an error to call the `sd` function with an array of size 0.

*Available since 2.0*

**Norms**

real `norm1`(vector x)
The L1 norm of x, defined by

\[
\text{norm1}(x) = \sum_{n=1}^{N}(|x_n|)
\]

where N is the size of x.

*Available since 2.30*

real `norm1`(row_vector x)
The L1 norm of x

*Available since 2.30*

real `norm1`(array[] real x)
The L1 norm of x

*Available since 2.30*

real `norm2`(vector x)
The L2 norm of x, defined by

\[
\text{norm2}(x) = \sqrt{\sum_{n=1}^{N}(x_n)^2}
\]

where N is the size of x

*Available since 2.30*

real `norm2`(row_vector x)
The L2 norm of x

*Available since 2.30*

real `norm2`(array[] real x)
The L2 norm of x

*Available since 2.30*
Euclidean distance and squared distance

\texttt{real distance(vector \ x, vector \ y)}

The Euclidean distance between \(x\) and \(y\), defined by

\[
\text{distance}(x, y) = \sqrt{\sum_{n=1}^{N} (x_n - y_n)^2}
\]

where \(N\) is the size of \(x\) and \(y\). It is an error to call \texttt{distance} with arguments of unequal size.

\textit{Available since 2.2}

\texttt{real distance(vector \ x, row_vector \ y)}

The Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.2}

\texttt{real distance(row_vector \ x, vector \ y)}

The Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.2}

\texttt{real distance(row_vector \ x, row_vector \ y)}

The Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.2}

\texttt{real squared_distance(vector \ x, vector \ y)}

The squared Euclidean distance between \(x\) and \(y\), defined by

\[
\text{squared\_distance}(x, y) = \text{distance}(x, y)^2 = \sum_{n=1}^{N} (x_n - y_n)^2,
\]

where \(N\) is the size of \(x\) and \(y\). It is an error to call \texttt{squared\_distance} with arguments of unequal size.

\textit{Available since 2.7}

\texttt{real squared_distance(vector \ x, row_vector \ y)}

The squared Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.26}

\texttt{real squared_distance(row_vector \ x, vector \ y)}

The squared Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.26}

\texttt{real squared_distance(row_vector \ x, row_vector \ y)}

The Euclidean distance between \(x\) and \(y\)

\textit{Available since 2.26}
Quantile

Produces sample quantiles corresponding to the given probabilities. The smallest
observation corresponds to a probability of 0 and the largest to a probability of 1.

Implements algorithm 7 from Hyndman, R. J. and Fan, Y., Sample quantiles in Statistical Packages (R’s default quantile function).

```plaintext
real quantile(data array[] real x, data real p)
The p-th quantile of x
Available since 2.27
```

```plaintext
array[] real quantile(data array[] real x, data array[] real p)
An array containing the quantiles of x given by the array of probabilities p
Available since 2.27
```

5.2. Array size and dimension function

The size of an array or matrix can be obtained using the `dims()` function. The `dims()` function is defined to take an argument consisting of any variable with up to 8 array dimensions (and up to 2 additional matrix dimensions) and returns an array of integers with the dimensions. For example, if two variables are declared as follows,

```plaintext
array[7, 8, 9] real x;
```

then calling `dims(x)` or `dims(y)` returns an integer array of size 3 containing the elements 7, 8, and 9 in that order.

The `size()` function extracts the number of elements in an array. This is just the top-level elements, so if the array is declared as

```plaintext
array[M, N] real a;
```

the size of `a` is `M`.

The function `num_elements`, on the other hand, measures all of the elements, so that the array `a` above has `M \times N` elements.

The specialized functions `rows()` and `cols()` should be used to extract the dimensions of vectors and matrices.

```plaintext
array[] int dims(T x)
Return an integer array containing the dimensions of x; the type of the argument T
```
can be any Stan type with up to 8 array dimensions.

Available since 2.0

```stan
int num_elements(array[] T x)
```

Return the total number of elements in the array x including all elements in contained arrays, vectors, and matrices. T can be any array type. For example, if x is of type array[4, 3] real then num_elements(x) is 12, and if y is declared as array[5] matrix[3, 4] y, then size(y) evaluates to 60.

Available since 2.5

```stan
int size(array[] T x)
```

Return the number of elements in the array x; the type of the array T can be any type, but the size is just the size of the top level array, not the total number of elements contained. For example, if x is of type array[4, 3] real then size(x) is 4.

Available since 2.0

5.3. Array broadcasting

The following operations create arrays by repeating elements to fill an array of a specified size. These operations work for all input types T, including reals, integers, vectors, row vectors, matrices, or arrays.

```stan
array[] T rep_array(T x, int n)
```

Return the n array with every entry assigned to x.

Available since 2.0

```stan
array[,] T rep_array(T x, int m, int n)
```

Return the m by n array with every entry assigned to x.

Available since 2.0

```stan
array[„] T rep_array(T x, int k, int m, int n)
```

Return the k by m by n array with every entry assigned to x.

Available since 2.0

For example, rep_array(1.0,5) produces a real array (type array[] real) of size 5 with all values set to 1.0. On the other hand, rep_array(1,5) produces an integer array (type array[] int) of size 5 with all values set to 1. This distinction is important because it is not possible to assign an integer array to a real array. For example, the following example contrasts legal with illegal array creation and assignment.
array[5] real y;
array[5] int x;

x = rep_array(1, 5);    // ok
y = rep_array(1.0, 5);  // ok

x = rep_array(1.0, 5);  // illegal
y = rep_array(1, 5);    // illegal

x = y;                  // illegal
y = x;                  // illegal

If the value being repeated \( v \) is a vector (i.e., \( T \) is vector), then \( \text{rep\_array}(v, 27) \) is a size 27 array consisting of 27 copies of the vector \( v \).

vector[5] v;

a = rep_array(v, 3);    // fill a with copies of v
a[2, 4] = 9.0;          // \( v[4], a[1, 4], a[3, 4] \) unchanged

If the type \( T \) of \( x \) is itself an array type, then the result will be an array with one, two, or three added dimensions, depending on which of the \( \text{rep\_array} \) functions is called. For instance, consider the following legal code snippet.

array[5, 6] real a;
array[3, 4, 5, 6] real b;

b = rep_array(a, 3, 4);  // make (3 x 4) copies of a
b[1, 1, 1, 1] = 27.9;     // \( a[1, 1] \) unchanged

After the assignment to \( b \), the value for \( b[j, k, m, n] \) is equal to \( a[m, n] \) where it is defined, for \( j \) in 1:3, \( k \) in 1:4, \( m \) in 1:5, and \( n \) in 1:6.

5.4. Array concatenation

\( \text{append\_array}(T \ x, T \ y) \)

Return the concatenation of two arrays in the order of the arguments. \( T \) must be an \( N \)-dimensional array of any Stan type (with a maximum \( N \) of 7). All dimensions but the first must match.

*Available since 2.18*
For example, the following code appends two three dimensional arrays of matrices together. Note that all dimensions except the first match. Any mismatches will cause an error to be thrown.

```plaintext
array[2, 1, 7] matrix[4, 6] x1;
array[3, 1, 7] matrix[4, 6] x2;
array[5, 1, 7] matrix[4, 6] x3;

x3 = append_array(x1, x2);
```

### 5.5. Sorting functions

Sorting can be used to sort values or the indices of those values in either ascending or descending order. For example, if \( v \) is declared as a real array of size 3, with values

\[
v = (1, -10.3, 20.987),
\]

then the various sort routines produce

\[
\begin{align*}
\text{sort}_\text{asc}(v) &= (-10.3, 1, 20.987) \\
\text{sort}_\text{desc}(v) &= (20.987, 1, -10.3) \\
\text{sort}_\text{indices}_\text{asc}(v) &= (2, 1, 3) \\
\text{sort}_\text{indices}_\text{desc}(v) &= (3, 1, 2)
\end{align*}
\]

```plaintext
array[] real $\text{sort}_\text{asc}$
(array[] real v)
Sort the elements of \( v \) in ascending order
Available since 2.0

array[] int $\text{sort}_\text{asc}$
(array[] int v)
Sort the elements of \( v \) in ascending order
Available since 2.0

array[] real $\text{sort}_\text{desc}$
(array[] real v)
Sort the elements of \( v \) in descending order
Available since 2.0

array[] int $\text{sort}_\text{desc}$
(array[] int v)
Sort the elements of \( v \) in descending order
Available since 2.0

array[] int $\text{sort}_\text{indices}_\text{asc}$
(array[] real v)
Return an array of indices between 1 and the size of \( v \), sorted to index \( v \) in ascending
```
order.

Available since 2.3

array[] int sort_indices_asc(array[] int v)
Return an array of indices between 1 and the size of v, sorted to index v in ascending order.

Available since 2.3

array[] int sort_indices_desc(array[] real v)
Return an array of indices between 1 and the size of v, sorted to index v in descending order.

Available since 2.3

array[] int sort_indices_desc(array[] int v)
Return an array of indices between 1 and the size of v, sorted to index v in descending order.

Available since 2.3

int rank(array[] real v, int s)
Number of components of v less than v[s]

Available since 2.0

int rank(array[] int v, int s)
Number of components of v less than v[s]

Available since 2.0

5.6. Reversing functions

Stan provides functions to create a new array by reversing the order of elements in an existing array. For example, if \( v \) is declared as a real array of size 3, with values

\[
v = (1, -10.3, 20.987),
\]

then

\[
\text{reverse}(v) = (20.987, -10.3, 1).
\]

array[] T reverse(array[] T v)
Return a new array containing the elements of the argument in reverse order.

Available since 2.23
6. Matrix Operations

6.1. Integer-valued matrix size functions

int num_elements(vector x)
The total number of elements in the vector x (same as function rows)
Available since 2.5

int num_elements(row_vector x)
The total number of elements in the vector x (same as function cols)
Available since 2.5

int num_elements(matrix x)
The total number of elements in the matrix x. For example, if x is a $5 \times 3$ matrix, then num_elements(x) is 15
Available since 2.5

int rows(vector x)
The number of rows in the vector x
Available since 2.0

int rows(row_vector x)
The number of rows in the row vector x, namely 1
Available since 2.0

int rows(matrix x)
The number of rows in the matrix x
Available since 2.0

int cols(vector x)
The number of columns in the vector x, namely 1
Available since 2.0

int cols(row_vector x)
The number of columns in the row vector x
Available since 2.0

int cols(matrix x)
The number of columns in the matrix x
Available since 2.0
int size(vector x)
The size of x, i.e., the number of elements
Available since 2.26

int size(row_vector x)
The size of x, i.e., the number of elements
Available since 2.26

int size(matrix x)
The size of the matrix x. For example, if x is a $5 \times 3$ matrix, then size(x) is 15
Available since 2.26

6.2. Matrix arithmetic operators
Stan supports the basic matrix operations using infix, prefix and postfix operations. This section lists the operations supported by Stan along with their argument and result types.

Negation prefix operators
vector operator-(vector x)
The negation of the vector x.
Available since 2.0

row_vector operator-(row_vector x)
The negation of the row vector x.
Available since 2.0

matrix operator-(matrix x)
The negation of the matrix x.
Available since 2.0

T operator-(T x)
Vectorized version of operator-. If T x is a (possibly nested) array of matrix types, -x is the same shape array where each individual value is negated.
Available since 2.31

Infix matrix operators
vector operator+(vector x, vector y)
The sum of the vectors x and y.
Available since 2.0

row_vector operator+(row_vector x, row_vector y)
The sum of the row vectors x and y.
Available since 2.0
6.2. **MATRIX ARITHMETIC OPERATORS**

- **matrix operator+(matrix x, matrix y)**
  The sum of the matrices x and y
  *Available since 2.0*

- **vector operator-(vector x, vector y)**
  The difference between the vectors x and y.
  *Available since 2.0*

- **row_vector operator-(row_vector x, row_vector y)**
  The difference between the row vectors x and y
  *Available since 2.0*

- **matrix operator-(matrix x, matrix y)**
  The difference between the matrices x and y
  *Available since 2.0*

- **vector operator*(real x, vector y)**
  The product of the scalar x and vector y
  *Available since 2.0*

- **row_vector operator*(real x, row_vector y)**
  The product of the scalar x and the row vector y
  *Available since 2.0*

- **matrix operator*(real x, matrix y)**
  The product of the scalar x and the matrix y
  *Available since 2.0*

- **vector operator*(vector x, real y)**
  The product of the scalar y and vector x
  *Available since 2.0*

- **matrix operator*(vector x, row_vector y)**
  The product of the vector x and row vector y
  *Available since 2.0*

- **row_vector operator*(row_vector x, real y)**
  The product of the scalar y and row vector x
  *Available since 2.0*

- **real operator*(row_vector x, vector y)**
  The product of the row vector x and vector y
  *Available since 2.0*
row_vector operator\*(row_vector x, matrix y)
The product of the row vector x and matrix y
*Available since 2.0*

matrix operator\*(matrix x, real y)
The product of the scalar y and matrix x
*Available since 2.0*

vector operator\*(matrix x, vector y)
The product of the matrix x and vector y
*Available since 2.0*

matrix operator\*(matrix x, matrix y)
The product of the matrices x and y
*Available since 2.0*

**Broadcast infix operators**

vector operator+(vector x, real y)
The result of adding y to every entry in the vector x
*Available since 2.0*

vector operator+(real x, vector y)
The result of adding x to every entry in the vector y
*Available since 2.0*

row_vector operator+(row_vector x, real y)
The result of adding y to every entry in the row vector x
*Available since 2.0*

row_vector operator+(real x, row_vector y)
The result of adding x to every entry in the row vector y
*Available since 2.0*

matrix operator+(matrix x, real y)
The result of adding y to every entry in the matrix x
*Available since 2.0*

matrix operator+(real x, matrix y)
The result of adding x to every entry in the matrix y
*Available since 2.0*

vector operator-(vector x, real y)
The result of subtracting y from every entry in the vector x
*Available since 2.0*
6.3. **TRANSPOSITION OPERATOR**

Vector \texttt{operator-}(\texttt{real} \ x, \ \texttt{vector} \ y)

The result of adding \(x\) to every entry in the negation of the vector \(y\)

*Available since 2.0*

Row vector \texttt{operator-}(\texttt{row_vector} \ x, \ \texttt{real} \ y)

The result of subtracting \(y\) from every entry in the row vector \(x\)

*Available since 2.0*

Row vector \texttt{operator-}(\texttt{real} \ x, \ \texttt{row_vector} \ y)

The result of adding \(x\) to every entry in the negation of the row vector \(y\)

*Available since 2.0*

Matrix \texttt{operator-}(\texttt{matrix} \ x, \ \texttt{real} \ y)

The result of subtracting \(y\) from every entry in the matrix \(x\)

*Available since 2.0*

Matrix \texttt{operator-}(\texttt{real} \ x, \ \texttt{matrix} \ y)

The result of adding \(x\) to every entry in negation of the matrix \(y\)

*Available since 2.0*

Vector \texttt{operator/}(\texttt{vector} \ x, \ \texttt{real} \ y)

The result of dividing each entry in the vector \(x\) by \(y\)

*Available since 2.0*

Row vector \texttt{operator/}(\texttt{row_vector} \ x, \ \texttt{real} \ y)

The result of dividing each entry in the row vector \(x\) by \(y\)

*Available since 2.0*

Matrix \texttt{operator/}(\texttt{matrix} \ x, \ \texttt{real} \ y)

The result of dividing each entry in the matrix \(x\) by \(y\)

*Available since 2.0*

### 6.3. Transposition operator

Matrix transposition is represented using a postfix operator.

Matrix \texttt{operator'}(\texttt{matrix} \ x)

The transpose of the matrix \(x\), written as \(x'\)

*Available since 2.0*

Row vector \texttt{operator'}(\texttt{vector} \ x)

The transpose of the vector \(x\), written as \(x'\)

*Available since 2.0*

Vector \texttt{operator'}(\texttt{row_vector} \ x)

The transpose of the row vector \(x\), written as \(x'\)

*Available since 2.0*
The transpose of the row vector $\mathbf{x}$, written as $\mathbf{x}'$

*Available since 2.0*

### 6.4. Elementwise functions

Elementwise functions apply a function to each element of a vector or matrix, returning a result of the same shape as the argument. There are many functions that are vectorized in addition to the ad hoc cases listed in this section; see section function vectorization for the general cases.

- **vector** `operator.*`(vector $\mathbf{x}$, vector $\mathbf{y}$)
  The elementwise product of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.0*

- **row_vector** `operator.*`(row_vector $\mathbf{x}$, row_vector $\mathbf{y}$)
  The elementwise product of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.0*

- **matrix** `operator.*`(matrix $\mathbf{x}$, matrix $\mathbf{y}$)
  The elementwise product of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.0*

- **vector** `operator ./`(vector $\mathbf{x}$, vector $\mathbf{y}$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.0*

- **vector** `operator ./`(vector $\mathbf{x}$, real $y$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.4*

- **vector** `operator ./`(real $x$, vector $\mathbf{y}$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.4*

- **row_vector** `operator ./`(row_vector $\mathbf{x}$, row_vector $\mathbf{y}$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.0*

- **row_vector** `operator ./`(row_vector $\mathbf{x}$, real $y$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.4*

- **row_vector** `operator ./`(real $x$, row_vector $\mathbf{y}$)
  The elementwise quotient of $\mathbf{y}$ and $\mathbf{x}$
  *Available since 2.4*
6.4. ELEMENTWISE FUNCTIONS

matrix operator./(matrix x, matrix y)
The elementwise quotient of y and x
Available since 2.0

matrix operator./(matrix x, real y)
The elementwise quotient of y and x
Available since 2.4

matrix operator./(real x, matrix y)
The elementwise quotient of y and x
Available since 2.4

vector operator.^(vector x, vector y)
The elementwise power of y and x
Available since 2.24

vector operator.^(vector x, real y)
The elementwise power of y and x
Available since 2.24

vector operator.^(real x, vector y)
The elementwise power of y and x
Available since 2.24

row_vector operator.^(row_vector x, row_vector y)
The elementwise power of y and x
Available since 2.24

row_vector operator.^(row_vector x, real y)
The elementwise power of y and x
Available since 2.24

row_vector operator.^(real x, row_vector y)
The elementwise power of y and x
Available since 2.24

matrix operator.^(matrix x, matrix y)
The elementwise power of y and x
Available since 2.24

matrix operator.^(matrix x, real y)
The elementwise power of y and x
Available since 2.24
matrix operator.^(real x, matrix y)
The elementwise power of y and x
Available since 2.24

6.5. Dot products and specialized products

real dot_product(vector x, vector y)
The dot product of x and y
Available since 2.0

real dot_product(vector x, row_vector y)
The dot product of x and y
Available since 2.0

real dot_product(row_vector x, vector y)
The dot product of x and y
Available since 2.0

real dot_product(row_vector x, row_vector y)
The dot product of x and y
Available since 2.0

row_vector columns_dot_product(vector x, vector y)
The dot product of the columns of x and y
Available since 2.0

row_vector columns_dot_product(row_vector x, row_vector y)
The dot product of the columns of x and y
Available since 2.0

row_vector columns_dot_product(matrix x, matrix y)
The dot product of the columns of x and y
Available since 2.0

vector rows_dot_product(vector x, vector y)
The dot product of the rows of x and y
Available since 2.0

vector rows_dot_product(row_vector x, row_vector y)
The dot product of the rows of x and y
Available since 2.0

vector rows_dot_product(matrix x, matrix y)
The dot product of the rows of x and y
Available since 2.0
real `dot_self`(vector x)
The dot product of the vector x with itself
`Available since 2.0`

real `dot_self`(row_vector x)
The dot product of the row vector x with itself
`Available since 2.0`

row_vector `columns_dot_self`(vector x)
The dot product of the columns of x with themselves
`Available since 2.0`

row_vector `columns_dot_self`(row_vector x)
The dot product of the columns of x with themselves
`Available since 2.0`

row_vector `columns_dot_self`(matrix x)
The dot product of the columns of x with themselves
`Available since 2.0`

vector `rows_dot_self`(vector x)
The dot product of the rows of x with themselves
`Available since 2.0`

vector `rows_dot_self`(row_vector x)
The dot product of the rows of x with themselves
`Available since 2.0`

vector `rows_dot_self`(matrix x)
The dot product of the rows of x with themselves
`Available since 2.0`

**Specialized products**

matrix `tcrossprod`(matrix x)
The product of x postmultiplied by its own transpose, similar to the tcrossprod(x) function in R. The result is a symmetric matrix $xx^\top$.
`Available since 2.0`

matrix `crossprod`(matrix x)
The product of x premultiplied by its own transpose, similar to the crossprod(x) function in R. The result is a symmetric matrix $x^\top x$.
`Available since 2.0`

The following functions all provide shorthand forms for common expressions,
which are also much more efficient.

\texttt{matrix quad\_form(matrix A, matrix B)}
The quadratic form, i.e., $B' \ast A \ast B$.
\textit{Available since 2.0}

\texttt{real quad\_form(matrix A, vector B)}
The quadratic form, i.e., $B' \ast A \ast B$.
\textit{Available since 2.0}

\texttt{matrix quad\_form\_diag(matrix m, vector v)}
The quadratic form using the column vector $v$ as a diagonal matrix, i.e., 
$\text{diag}_\text{matrix}(v) \ast m \ast \text{diag}_\text{matrix}(v)$.
\textit{Available since 2.3}

\texttt{matrix quad\_form\_diag(matrix m, row\_vector rv)}
The quadratic form using the row vector $rv$ as a diagonal matrix, i.e., 
$\text{diag}_\text{matrix}(rv) \ast m \ast \text{diag}_\text{matrix}(rv)$.
\textit{Available since 2.3}

\texttt{matrix quad\_form\_sym(matrix A, matrix B)}
Similarly to \texttt{quad\_form}, gives $B' \ast A \ast B$, but additionally checks if $A$ is symmetric and ensures that the result is also symmetric.
\textit{Available since 2.3}

\texttt{real quad\_form\_sym(matrix A, vector B)}
Similarly to \texttt{quad\_form}, gives $B' \ast A \ast B$, but additionally checks if $A$ is symmetric and ensures that the result is also symmetric.
\textit{Available since 2.3}

\texttt{real trace\_quad\_form(matrix A, matrix B)}
The trace of the quadratic form, i.e., $\text{trace}(B' \ast A \ast B)$.
\textit{Available since 2.0}

\texttt{real trace\_gen\_quad\_form(matrix D, matrix A, matrix B)}
The trace of a generalized quadratic form, i.e., $\text{trace}(D \ast B' \ast A \ast B)$.
\textit{Available since 2.0}

\texttt{matrix multiply\_lower\_tri\_self\_transpose(matrix x)}
The product of the lower triangular portion of $x$ (including the diagonal) times its own transpose; that is, if $L$ is a matrix of the same dimensions as $x$ with $L(m,n)$ equal to $x(m,n)$ for $n \leq m$ and $L(m,n)$ equal to 0 if $n > m$, the result is the symmetric matrix $L L^\top$. This is a specialization of $\text{tcrossprod}(x)$ for lower-triangular matrices.
The input matrix does not need to be square.  
*Available since 2.0*

```cpp
matrix diag_pre_multiply(vector v, matrix m)
Return the product of the diagonal matrix formed from the vector v and the matrix m, i.e., \(\text{diag}_\text{matrix}(v) \times m\).
*Available since 2.0*
```

```cpp
matrix diag_pre_multiply(row_vector rv, matrix m)
Return the product of the diagonal matrix formed from the vector rv and the matrix m, i.e., \(\text{diag}_\text{matrix}(rv) \times m\).
*Available since 2.0*
```

```cpp
matrix diag_post_multiply(matrix m, vector v)
Return the product of the matrix m and the diagonal matrix formed from the vector v, i.e., \(m \times \text{diag}_\text{matrix}(v)\).
*Available since 2.0*
```

```cpp
matrix diag_post_multiply(matrix m, row_vector rv)
Return the product of the matrix m and the diagonal matrix formed from the row vector rv, i.e., \(m \times \text{diag}_\text{matrix}(rv)\).
*Available since 2.0*
```

### 6.6. Reductions

#### Log sum of exponents

```cpp
real log_sum_exp(vector x)
The natural logarithm of the sum of the exponentials of the elements in x
*Available since 2.0*
```

```cpp
real log_sum_exp(row_vector x)
The natural logarithm of the sum of the exponentials of the elements in x
*Available since 2.0*
```

```cpp
real log_sum_exp(matrix x)
The natural logarithm of the sum of the exponentials of the elements in x
*Available since 2.0*
```

#### Minimum and maximum

```cpp
real min(vector x)
The minimum value in x, or \(+\infty\) if x is empty
*Available since 2.0*
```

```cpp
real min(row_vector x)
```
The minimum value in x, or $+\infty$ if x is empty

*Available since 2.0*

`real min(matrix x)`

The minimum value in x, or $+\infty$ if x is empty

*Available since 2.0*

`real max(vector x)`

The maximum value in x, or $-\infty$ if x is empty

*Available since 2.0*

`real max(row_vector x)`

The maximum value in x, or $-\infty$ if x is empty

*Available since 2.0*

`real max(matrix x)`

The maximum value in x, or $-\infty$ if x is empty

*Available since 2.0*

**Sums and products**

`real sum(vector x)`

The sum of the values in x, or 0 if x is empty

*Available since 2.0*

`real sum(row_vector x)`

The sum of the values in x, or 0 if x is empty

*Available since 2.0*

`real sum(matrix x)`

The sum of the values in x, or 0 if x is empty

*Available since 2.0*

`real prod(vector x)`

The product of the values in x, or 1 if x is empty

*Available since 2.0*

`real prod(row_vector x)`

The product of the values in x, or 1 if x is empty

*Available since 2.0*

`real prod(matrix x)`

The product of the values in x, or 1 if x is empty

*Available since 2.0*
Sample moments
Full definitions are provided for sample moments in section array reductions.

`real mean(vector x)`
The sample mean of the values in x; see section array reductions for details.
*Available since 2.0*

`real mean(row_vector x)`
The sample mean of the values in x; see section array reductions for details.
*Available since 2.0*

`real mean(matrix x)`
The sample mean of the values in x; see section array reductions for details.
*Available since 2.0*

`real variance(vector x)`
The sample variance of the values in x; see section array reductions for details.
*Available since 2.0*

`real variance(row_vector x)`
The sample variance of the values in x; see section array reductions for details.
*Available since 2.0*

`real variance(matrix x)`
The sample variance of the values in x; see section array reductions for details.
*Available since 2.0*

`real sd(vector x)`
The sample standard deviation of the values in x; see section array reductions for details.
*Available since 2.0*

`real sd(row_vector x)`
The sample standard deviation of the values in x; see section array reductions for details.
*Available since 2.0*

`real sd(matrix x)`
The sample standard deviation of the values in x; see section array reductions for details.
*Available since 2.0*
Quantile
Produces sample quantiles corresponding to the given probabilities. The smallest
observation corresponds to a probability of 0 and the largest to a probability of 1.

Implements algorithm 7 from Hyndman, R. J. and Fan, Y., Sample quantiles in
Statistical Packages (R’s default quantile function).

real quantile(data vector x, data real p)
The p-th quantile of x
Available since 2.27

array[] real quantile(data vector x, data array[] real p)
An array containing the quantiles of x given by the array of probabilities p
Available since 2.27

real quantile(data row_vector x, data real p)
The p-th quantile of x
Available since 2.27

array[] real quantile(data row_vector x, data array[] real p)
An array containing the quantiles of x given by the array of probabilities p
Available since 2.27

6.7. Broadcast functions
The following broadcast functions allow vectors, row vectors and matrices to be
created by copying a single element into all of their cells. Matrices may also be
created by stacking copies of row vectors vertically or stacking copies of column
vectors horizontally.

vector rep_vector(real x, int m)
Return the size m (column) vector consisting of copies of x.
Available since 2.0

row_vector rep_row_vector(real x, int n)
Return the size n row vector consisting of copies of x.
Available since 2.0

matrix rep_matrix(real x, int m, int n)
Return the m by n matrix consisting of copies of x.
Available since 2.0

matrix rep_matrix(vector v, int n)
Return the m by n matrix consisting of n copies of the (column) vector v of size m.
6.8. **DIAGONAL MATRIX FUNCTIONS**

*Available since 2.0*

**matrix** `rep_matrix(row_vector rv, int m)`

Return the m by n matrix consisting of m copies of the row vector rv of size n.

*Available since 2.0*

Unlike the situation with array broadcasting (see section array broadcasting), where there is a distinction between integer and real arguments, the following two statements produce the same result for vector broadcasting; row vector and matrix broadcasting behave similarly.

```plaintext
vector[3] x;
x = rep_vector(1, 3);
x = rep_vector(1.0, 3);
```

There are no integer vector or matrix types, so integer values are automatically promoted.

**Symmetrization**

**matrix** `symmetrize_from_lower_tri(matrix A)`

Construct a symmetric matrix from the lower triangle of A.

*Available since 2.26*

---

### 6.8. Diagonal matrix functions

**matrix** `add_diag(matrix m, row_vector d)`

Add row_vector d to the diagonal of matrix m.

*Available since 2.21*

**matrix** `add_diag(matrix m, vector d)`

Add vector d to the diagonal of matrix m.

*Available since 2.21*

**matrix** `add_diag(matrix m, real d)`

Add scalar d to every diagonal element of matrix m.

*Available since 2.21*

**vector** `diagonal(matrix x)`

The diagonal of the matrix x

*Available since 2.0*

**matrix** `diag_matrix(vector x)`

The diagonal matrix with diagonal x
Although the `diag_matrix` function is available, it is unlikely to ever show up in an efficient Stan program. For example, rather than converting a diagonal to a full matrix for use as a covariance matrix,

```
y ~ multi_normal(mu, diag_matrix(square(sigma)));  
```

it is much more efficient to just use a univariate normal, which produces the same density,

```
y ~ normal(mu, sigma);  
```

Rather than writing `m * diag_matrix(v)` where `m` is a matrix and `v` is a vector, it is much more efficient to write `diag_post_multiply(m, v)` (and similarly for pre-multiplication). By the same token, it is better to use `quad_form_diag(m, v)` rather than `quad_form(m, diag_matrix(v))`.

```matrix identity_matrix(int k) Create an identity matrix of size k \times k  
```

```6.9. Container construction functions

array[] real  `linspaced_array`(int n, data real lower, data real upper) Create a real array of length `n` of equidistantly-spaced elements between `lower` and `upper`  
```

```array[] int linspaced_int_array(int n, int lower, int upper) Create a regularly spaced, increasing integer array of length `n` between `lower` and `upper`, inclusively. If `(upper - lower) / (n - 1)` is less than one, repeat each output `(n - 1) / (upper - lower)` times. If neither `(upper - lower) / (n - 1)` or `(n - 1) / (upper - lower)` are integers, `upper` is reduced until one of these is true.  
```

```vector linspaced_vector(int n, data real lower, data real upper) Create an `n`-dimensional vector of equidistantly-spaced elements between `lower` and `upper`  
```

```row_vector linspaced_row_vector(int n, data real lower, data real upper) Create an `n`-dimensional row vector of equidistantly-spaced elements between `lower` and `upper`  
```
upper)
Create an $n$-dimensional row-vector of equidistantly-spaced elements between lower and upper
Available since 2.24

array[] int one_hot_int_array(int n, int k)
Create a one-hot encoded int array of length $n$ with $\text{array}[k] = 1$
Available since 2.24

array[] real one_hot_array(int n, int k)
Create a one-hot encoded real array of length $n$ with $\text{array}[k] = 1$
Available since 2.24

vector one_hot_vector(int n, int k)
Create an $n$-dimensional one-hot encoded vector with $\text{vector}[k] = 1$
Available since 2.24

row_vector one_hot_row_vector(int n, int k)
Create an $n$-dimensional one-hot encoded row-vector with $\text{row_vector}[k] = 1$
Available since 2.24

array[] int ones_int_array(int n)
Create an int array of length $n$ of all ones
Available since 2.26

array[] real ones_array(int n)
Create a real array of length $n$ of all ones
Available since 2.26

vector ones_vector(int n)
Create an $n$-dimensional vector of all ones
Available since 2.26

row_vector ones_row_vector(int n)
Create an $n$-dimensional row-vector of all ones
Available since 2.26

array[] int zeros_int_array(int n)
Create an int array of length $n$ of all zeros
Available since 2.26

array[] real zeros_array(int n)
Create a real array of length $n$ of all zeros
Available since 2.24
vector **zeros_vector**(int n)
Create an n-dimensional vector of all zeros
*Available since 2.24*

**row_vector** **zeros_row_vector**(int n)
Create an n-dimensional row-vector of all zeros
*Available since 2.24*

vector **uniform_simplex**(int n)
Create an n-dimensional simplex with elements vector[i] = 1 / n for all i ∈ 1,...,n
*Available since 2.24*

### 6.10. Slicing and blocking functions

Stan provides several functions for generating slices or blocks or diagonal entries for matrices.

**Columns and rows**

**vector col**(matrix x, int n)
The n-th column of matrix x
*Available since 2.0*

**row_vector row**(matrix x, int m)
The m-th row of matrix x
*Available since 2.0*

The **row** function is special in that it may be used as an lvalue in an assignment statement (i.e., something to which a value may be assigned). The **row** function is also special in that the indexing notation x[m] is just an alternative way of writing row(x, m). The **col** function may **not**, be used as an lvalue, nor is there an indexing based shorthand for it.

**Block operations**

**Matrix slicing operations**

Block operations may be used to extract a sub-block of a matrix.

**matrix block**(matrix x, int i, int j, int n_rows, int n_cols)
Return the submatrix of x that starts at row i and column j and extends n_rows rows and n_cols columns.
*Available since 2.0*

The sub-row and sub-column operations may be used to extract a slice of row or column from a matrix.
vector sub_col(matrix x, int i, int j, int n_rows)
Return the sub-column of x that starts at row i and column j and extends n_rows rows and 1 column.
Available since 2.0

row_vector sub_row(matrix x, int i, int j, int n_cols)
Return the sub-row of x that starts at row i and column j and extends 1 row and n_cols columns.
Available since 2.0

Vector and array slicing operations
The head operation extracts the first \( n \) elements of a vector and the tail operation the last. The segment operation extracts an arbitrary subvector.

vector head(vector v, int n)
Return the vector consisting of the first \( n \) elements of v.
Available since 2.0

row_vector head(row_vector rv, int n)
Return the row vector consisting of the first \( n \) elements of rv.
Available since 2.0

array[] T head(array[] T sv, int n)
Return the array consisting of the first \( n \) elements of sv; applies to up to three-dimensional arrays containing any type of elements T.
Available since 2.0

vector tail(vector v, int n)
Return the vector consisting of the last \( n \) elements of v.
Available since 2.0

row_vector tail(row_vector rv, int n)
Return the row vector consisting of the last \( n \) elements of rv.
Available since 2.0

array[] T tail(array[] T sv, int n)
Return the array consisting of the last \( n \) elements of sv; applies to up to three-dimensional arrays containing any type of elements T.
Available since 2.0

vector segment(vector v, int i, int n)
Return the vector consisting of the \( n \) elements of v starting at \( i \); i.e., elements \( i \) through through \( i + n - 1 \).
Available since 2.0
row_vector segment(row_vector rv, int i, int n)
Return the row vector consisting of the n elements of rv starting at i; i.e., elements i through through i + n - 1.
Available since 2.10

array[] T segment(array[] T sv, int i, int n)
Return the array consisting of the n elements of sv starting at i; i.e., elements i through through i + n - 1. Applies to up to three-dimensional arrays containing any type of elements T.
Available since 2.0

6.11. Matrix concatenation
Stan’s matrix concatenation operations append_col and append_row are like the operations cbind and rbind in R.

Horizontal concatenation
matrix append_col(matrix x, matrix y)
Combine matrices x and y by column. The matrices must have the same number of rows.
Available since 2.5

matrix append_col(matrix x, vector y)
Combine matrix x and vector y by column. The matrix and the vector must have the same number of rows.
Available since 2.5

matrix append_col(vector x, matrix y)
Combine vector x and matrix y by column. The vector and the matrix must have the same number of rows.
Available since 2.5

matrix append_col(vector x, vector y)
Combine vectors x and y by column. The vectors must have the same number of rows.
Available since 2.5

row_vector append_col(row_vector x, row_vector y)
Combine row vectors x and y of any size into another row vector by appending y to the end of x.
Available since 2.5

row_vector append_col(real x, row_vector y)
Append x to the front of y, returning another row vector.
*Available since 2.12*

\[\text{row\_vector } \text{append\_col}(\text{row\_vector } x, \text{ real } y)\]

Append y to the end of x, returning another row vector.
*Available since 2.12*

**Vertical concatenation**

\[\text{matrix } \text{append\_row}(\text{matrix } x, \text{ matrix } y)\]

Combine matrices x and y by row. The matrices must have the same number of columns.
*Available since 2.5*

\[\text{matrix } \text{append\_row}(\text{matrix } x, \text{ row\_vector } y)\]

Combine matrix x and row vector y by row. The matrix and the row vector must have the same number of columns.
*Available since 2.5*

\[\text{matrix } \text{append\_row}(\text{row\_vector } x, \text{ matrix } y)\]

Combine row vector x and matrix y by row. The row vector and the matrix must have the same number of columns.
*Available since 2.5*

\[\text{matrix } \text{append\_row}(\text{row\_vector } x, \text{ row\_vector } y)\]

Combine row vectors x and y by row. The row vectors must have the same number of columns.
*Available since 2.5*

\[\text{vector } \text{append\_row}(\text{vector } x, \text{ vector } y)\]

Concatenate vectors x and y of any size into another vector.
*Available since 2.5*

\[\text{vector } \text{append\_row}(\text{real } x, \text{ vector } y)\]

Append x to the top of y, returning another vector.
*Available since 2.12*

\[\text{vector } \text{append\_row}(\text{vector } x, \text{ real } y)\]

Append y to the bottom of x, returning another vector.
*Available since 2.12*
6.12. Special matrix functions

Softmax

The softmax function maps $y \in \mathbb{R}^K$ to the $K$-simplex by

$$\text{softmax}(y) = \frac{\exp(y)}{\sum_{k=1}^{K} \exp(y_k)},$$

where $\exp(y)$ is the componentwise exponentiation of $y$. Softmax is usually calculated on the log scale,

$$\log \text{softmax}(y) = y - \log \sum_{k=1}^{K} \exp(y_k) = y - \log_{\text{sum}} \exp(y).$$

where the vector $y$ minus the scalar $\log_{\text{sum}} \exp(y)$ subtracts the scalar from each component of $y$.

Stan provides the following functions for softmax and its log.

- **vector softmax(vector x)**
  The softmax of $x$
  *Available since 2.0*

- **vector log_softmax(vector x)**
  The natural logarithm of the softmax of $x$
  *Available since 2.0*

Cumulative sums

The cumulative sum of a sequence $x_1, \ldots, x_N$ is the sequence $y_1, \ldots, y_N$, where

$$y_n = \sum_{m=1}^{n} x_m.$$
6.13. Gaussian Process Covariance Functions

The Gaussian process covariance functions compute the covariance between observations in an input data set or the cross-covariance between two input data sets.

For one dimensional GPs, the input data sets are arrays of scalars. The covariance matrix is given by $K_{ij} = k(x_i, x_j)$ (where $x_i$ is the $i^{th}$ element of the array $x$) and the cross-covariance is given by $K_{ij} = k(x_i, y_j)$.

For multi-dimensional GPs, the input data sets are arrays of vectors. The covariance matrix is given by $K_{ij} = k(x_i, x_j)$ (where $x_i$ is the $i^{th}$ vector in the array $x$) and the cross-covariance is given by $K_{ij} = k(x_i, y_j)$.

**Exponentiated quadratic kernel**

With magnitude $\sigma$ and length scale $l$, the exponentiated quadratic kernel is:

$$k(x_i, x_j) = \sigma^2 \exp \left( -\frac{|x_i - x_j|^2}{2l^2} \right)$$

**matrix**

\[
gp\text{-}exp\text{-}quad\text{-}cov(array[]\ real\ x,\ real\ sigma,\ real\ length\_scale)
\]

Gaussian process covariance with exponentiated quadratic kernel in one dimension. 

**Available since 2.20**

**matrix**

\[
gp\text{-}exp\text{-}quad\text{-}cov(array[]\ real\ x1,\ array[]\ real\ x2,\ real\ sigma,\ real\ length\_scale)
\]
Gaussian process cross-covariance of $x_1$ and $x_2$ with exponentiated quadratic kernel in one dimension.

*Available since 2.20*

matrix $\text{gp\_exp\_quad\_cov}(vectors \ x, \ real \ \sigma, \ real \ \text{length\_scale})$

Gaussian process covariance with exponentiated quadratic kernel in multiple dimensions.

*Available since 2.20*

matrix $\text{gp\_exp\_quad\_cov}(vectors \ x, \ real \ \sigma, \ array[\] \ real \ \text{length\_scale})$

Gaussian process covariance with exponentiated quadratic kernel in multiple dimensions with a length scale for each dimension.

*Available since 2.20*

matrix $\text{gp\_exp\_quad\_cov}(vectors \ x_1, \ vectors \ x_2, \ real \ \sigma, \ real \ \text{length\_scale})$

Gaussian process cross-covariance of $x_1$ and $x_2$ with exponentiated quadratic kernel in multiple dimensions.

*Available since 2.20*

matrix $\text{gp\_exp\_quad\_cov}(vectors \ x_1, \ vectors \ x_2, \ real \ \sigma, \ array[\] \ real \ \text{length\_scale})$

Gaussian process cross-covariance of $x_1$ and $x_2$ with exponentiated quadratic kernel in multiple dimensions with a length scale for each dimension.

*Available since 2.20*

**Dot product kernel**

With bias $\sigma_0$ the dot product kernel is:

$$k(x_i, x_j) = \sigma_0^2 + x_i^T x_j$$

matrix $\text{gp\_dot\_prod\_cov}(array[\] \ real \ x, \ real \ \sigma)$
Gaussian process covariance with dot product kernel in one dimension.  
*Available since 2.20*

```matlab
matrix gp_dot_prod_cov(array[] real x1, array[] real x2, real sigma)
```

Gaussian process cross-covariance of \(x_1\) and \(x_2\) with dot product kernel in one dimension.  
*Available since 2.20*

```matlab
matrix gp_dot_prod_cov(vectors x, real sigma)
```

Gaussian process covariance with dot product kernel in multiple dimensions.  
*Available since 2.20*

```matlab
matrix gp_dot_prod_cov(vectors x1, vectors x2, real sigma)
```

Gaussian process cross-covariance of \(x_1\) and \(x_2\) with dot product kernel in multiple dimensions.  
*Available since 2.20*

**Exponential kernel**

With magnitude \(\sigma\) and length scale \(l\), the exponential kernel is:

\[
k(x_i, x_j) = \sigma^2 \exp \left(-\frac{|x_i - x_j|}{l}\right)
\]

```matlab
matrix gp_exponential_cov(array[] real x, real sigma, real length_scale)
```

Gaussian process covariance with exponential kernel in one dimension.  
*Available since 2.20*

```matlab
matrix gp_exponential_cov(array[] real x1, array[] real x2, real sigma, real length_scale)
```

Gaussian process cross-covariance of \(x_1\) and \(x_2\) with exponential kernel in one dimension.  
*Available since 2.20*
matrix \texttt{gp_exponential_cov}(\text{vectors } x, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process covariance with exponential kernel in multiple dimensions.
\textit{Available since 2.20}

matrix \texttt{gp_exponential_cov}(\text{vectors } x, \text{real } \sigma, \text{array[[]] real } \text{length_scale})

Gaussian process covariance with exponential kernel in multiple dimensions with a length scale for each dimension.
\textit{Available since 2.20}

matrix \texttt{gp_exponential_cov}(\text{vectors } x_1, \text{vectors } x_2, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process cross-covariance of \(x_1\) and \(x_2\) with exponential kernel in multiple dimensions.
\textit{Available since 2.20}

matrix \texttt{gp_exponential_cov}(\text{vectors } x_1, \text{vectors } x_2, \text{real } \sigma, \text{array[[]] real } \text{length_scale})

Gaussian process cross-covariance of \(x_1\) and \(x_2\) with exponential kernel in multiple dimensions with a length scale for each dimension.
\textit{Available since 2.20}

**Matern 3/2 kernel**

With magnitude \(\sigma\) and length scale \(l\), the Matern 3/2 kernel is:

\[
k(x_i, x_j) = \sigma^2 \left(1 + \frac{\sqrt{3}|x_i - x_j|}{l}\right) \exp\left(-\frac{\sqrt{3}|x_i - x_j|}{l}\right)
\]

matrix \texttt{gp_matern32_cov}(\text{array[[]] real } x, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process covariance with Matern 3/2 kernel in one dimension.
\textit{Available since 2.20}
6.13. GAUSSIAN PROCESS COVARIANCE FUNCTIONS

matrix \texttt{gp_matern32_cov}(\text{array}[], \text{real } x1, \text{array}[], \text{real } x2, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process cross-covariance of \( x1 \) and \( x2 \) with Matern 3/2 kernel in one dimension.
*Available since 2.20*

matrix \texttt{gp_matern32_cov}(\text{vectors } x, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process covariance with Matern 3/2 kernel in multiple dimensions.
*Available since 2.20*

matrix \texttt{gp_matern32_cov}(\text{vectors } x, \text{real } \sigma, \text{array}[] \text{real } \text{length_scale})

Gaussian process covariance with Matern 3/2 kernel in multiple dimensions with a length scale for each dimension.
*Available since 2.20*

matrix \texttt{gp_matern32_cov}(\text{vectors } x1, \text{vectors } x2, \text{real } \sigma, \text{real } \text{length_scale})

Gaussian process cross-covariance of \( x1 \) and \( x2 \) with Matern 3/2 kernel in multiple dimensions.
*Available since 2.20*

matrix \texttt{gp_matern32_cov}(\text{vectors } x1, \text{vectors } x2, \text{real } \sigma, \text{array}[] \text{real } \text{length_scale})

Gaussian process cross-covariance of \( x1 \) and \( x2 \) with Matern 3/2 kernel in multiple dimensions with a length scale for each dimension.
*Available since 2.20*

**Matern 5/2 kernel**

With magnitude \( \sigma \) and length scale \( l \), the Matern 5/2 kernel is:

\[
k(x_i, x_j) = \sigma^2 \left( 1 + \frac{\sqrt{5}|x_i - x_j|}{l} + \frac{5|x_i - x_j|^2}{3l^2} \right) \exp\left( -\frac{\sqrt{5}|x_i - x_j|}{l} \right)
\]
matrix \texttt{gp_matern52_cov}(\texttt{array[]} \texttt{real} x, \texttt{real} \sigma, \texttt{real} \texttt{length\_scale})

Gaussian process covariance with Matern 5/2 kernel in one dimension.  
\textit{Available since 2.20}

matrix \texttt{gp_matern52_cov}(\texttt{array[]} \texttt{real} x1, \texttt{array[]} \texttt{real} x2, \texttt{real} \sigma, \texttt{real} \texttt{length\_scale})

Gaussian process cross-covariance of \texttt{x1} and \texttt{x2} with Matern 5/2 kernel in one dimension.  
\textit{Available since 2.20}

matrix \texttt{gp_matern52_cov}(\texttt{vectors} x, \texttt{real} \sigma, \texttt{real} \texttt{length\_scale})

Gaussian process covariance with Matern 5/2 kernel in multiple dimensions.  
\textit{Available since 2.20}

matrix \texttt{gp_matern52_cov}(\texttt{vectors} x, \texttt{real} \sigma, \texttt{array}[] \texttt{real} \texttt{length\_scale})

Gaussian process covariance with Matern 5/2 kernel in multiple dimensions with a length scale for each dimension.  
\textit{Available since 2.20}

matrix \texttt{gp_matern52_cov}(\texttt{vectors} x1, \texttt{vectors} x2, \texttt{real} \sigma, \texttt{real} \texttt{length\_scale})

Gaussian process cross-covariance of \texttt{x1} and \texttt{x2} with Matern 5/2 kernel in multiple dimensions.  
\textit{Available since 2.20}

matrix \texttt{gp_matern52_cov}(\texttt{vectors} x1, \texttt{vectors} x2, \texttt{real} \sigma, \texttt{array}[] \texttt{real} \texttt{length\_scale})

Gaussian process cross-covariance of \texttt{x1} and \texttt{x2} with Matern 5/2 kernel in multiple dimensions with a length scale for each dimension.  
\textit{Available since 2.20}
Periodic kernel
With magnitude $\sigma$, length scale $l$, and period $p$, the periodic kernel is:

$$k(x_i, x_j) = \sigma^2 \exp \left( - \frac{2 \sin^2 \left( \pi \frac{|x_i - x_j|}{p} \right)}{l^2} \right)$$

matrix $\text{gp}_\text{periodic}_\text{cov}(\text{array}\[\text{real}\ x, \ \text{real} \ \sigma, \ \text{real} \ \text{length}_\text{scale}, \ \text{real} \ \text{period})$

Gaussian process covariance with periodic kernel in one dimension.  
*Available since 2.20*

matrix $\text{gp}_\text{periodic}_\text{cov}(\text{array}\[\text{real}\ x1, \ \text{array}\[\text{real}\ x2, \ \text{real} \ \sigma, \ \text{real} \ \text{length}_\text{scale}, \ \text{real} \ \text{period})$

Gaussian process cross-covariance of $x1$ and $x2$ with periodic kernel in one dimension.  
*Available since 2.20*

matrix $\text{gp}_\text{periodic}_\text{cov}(\text{vectors} \ x, \ \text{real} \ \sigma, \ \text{real} \ \text{length}_\text{scale}, \ \text{real} \ \text{period})$

Gaussian process covariance with periodic kernel in multiple dimensions.  
*Available since 2.20*

matrix $\text{gp}_\text{periodic}_\text{cov}(\text{vectors} \ x1, \ \text{vectors} \ x2, \ \text{real} \ \sigma, \ \text{real} \ \text{length}_\text{scale}, \ \text{real} \ \text{period})$

Gaussian process cross-covariance of $x1$ and $x2$ with periodic kernel in multiple dimensions with a length scale for each dimension.  
*Available since 2.20*

6.14. Linear algebra functions and solvers

Matrix division operators and functions
In general, it is much more efficient and also more arithmetically stable to use matrix division than to multiply by an inverse. There are specialized forms for lower triangular matrices and for symmetric, positive-definite matrices.
Matrix division operators

row_vector operator/(row_vector b, matrix A)
The right division of b by A; equivalently b * inverse(A)

Available since 2.0

matrix operator/(matrix B, matrix A)
The right division of B by A; equivalently B * inverse(A)

Available since 2.5

vector operator\(\%(\text{matrix } A, \text{vector } b)
The left division of A by b; equivalently inverse(A) * b

Available since 2.18

matrix operator\%(\text{matrix } A, \text{matrix } B)
The left division of A by B; equivalently inverse(A) * B

Available since 2.18

Lower-triangular matrix division functions

There are four division functions which use lower triangular views of a matrix. The lower triangular view of a matrix tri(A) is used in the definitions and defined by

$$
\text{tri}(A)[m,n] = \begin{cases} 
A[m,n] & \text{if } m \geq n, \text{ and} \\
0 & \text{otherwise.}
\end{cases}
$$

When a lower triangular view of a matrix is used, the elements above the diagonal are ignored.

vector \text{mdivide_left_tri_low}(\text{matrix } A, \text{vector } b)
The left division of b by a lower-triangular view of A; algebraically equivalent to the less efficient and stable form inverse(tri(A)) * b, where tri(A) is the lower-triangular portion of A with the above-diagonal entries set to zero.

Available since 2.12

matrix \text{mdivide_left_tri_low}(\text{matrix } A, \text{matrix } B)
The left division of B by a triangular view of A; algebraically equivalent to the less efficient and stable form inverse(tri(A)) * B, where tri(A) is the lower-triangular portion of A with the above-diagonal entries set to zero.

Available since 2.5

row_vector \text{mdivide_right_tri_low}(\text{row_vector } b, \text{matrix } A)
The right division of b by a triangular view of A; algebraically equivalent to the less efficient and stable form b * inverse(tri(A)), where tri(A) is the lower-triangular portion of A with the above-diagonal entries set to zero.
6.14. LINEAR ALGEBRA FUNCTIONS AND SOLVERS

Available since 2.12

matrix mdivide_right_tri_low(matrix B, matrix A)
The right division of B by a triangular view of A; algebraically equivalent to the
less efficient and stable form \( B \times \text{inverse}(\text{tri}(A)) \), where \( \text{tri}(A) \) is the lower-triangular portion of A with the above-diagonal entries set to zero.

Available since 2.5

Symmetric positive-definite matrix division functions

There are four division functions which are specialized for efficiency and stability
for symmetric positive-definite matrix dividends. If the matrix dividend argument
is not symmetric and positive definite, these will reject and print warnings.

matrix mdivide_left_spd(matrix A, vector b)
The left division of b by the symmetric, positive-definite matrix A; algebraically
equivalent to the less efficient and stable form \( \text{inverse}(A) \times b \).

Available since 2.12

vector mdivide_left_spd(matrix A, matrix B)
The left division of B by the symmetric, positive-definite matrix A; algebraically
equivalent to the less efficient and stable form \( \text{inverse}(A) \times B \).

Available since 2.12

row_vector mdivide_right_spd(row_vector b, matrix A)
The right division of b by the symmetric, positive-definite matrix A; algebraically
equivalent to the less efficient and stable form \( b \times \text{inverse}(A) \).

Available since 2.12

matrix mdivide_right_spd(matrix B, matrix A)
The right division of B by the symmetric, positive-definite matrix A; algebraically
equivalent to the less efficient and stable form \( B \times \text{inverse}(A) \).

Available since 2.12

Matrix exponential

The exponential of the matrix \( A \) is formally defined by the convergent power series:

\[
e^A = \sum_{n=0}^{\infty} \frac{A^n}{n!}
\]

matrix matrix_exp(matrix A)
The matrix exponential of A

Available since 2.13
matrix `matrix_exp_multiply(matrix A, matrix B)`  
The multiplication of matrix exponential of A and matrix B; algebraically equivalent  
to the less efficient form `matrix_exp(A) * B`.  
`Available since 2.18`

matrix `scale_matrix_exp_multiply(real t, matrix A, matrix B)`  
The multiplication of matrix exponential of tA and matrix B; algebraically equivalent  
to the less efficient form `matrix_exp(t * A) * B`.  
`Available since 2.18`

**Matrix power**  
Returns the nth power of the specific matrix:  
\[ M^n = M_1 \times \ldots \times M_n \]

matrix `matrix_power(matrix A, int B)`  
Matrix A raised to the power B.  
`Available since 2.24`

**Linear algebra functions**  
*Trace*  
`real trace(matrix A)`  
The trace of A, or 0 if A is empty; A is not required to be diagonal  
`Available since 2.0`

*Determinants*  
`real determinant(matrix A)`  
The determinant of A  
`Available since 2.0`

`real log_determinant(matrix A)`  
The log of the absolute value of the determinant of A  
`Available since 2.0`

`real log_determinant_spd(matrix A)`  
The log of the absolute value of the determinant of the symmetric, positive-definite  
matrix A.  
`Available since 2.30`

*Inverses*  
It is almost never a good idea to use matrix inverses directly because they are  
both inefficient and arithmetically unstable compared to the alternatives. Rather  
than inverting a matrix m and post-multiplying by a vector or matrix a, as in
inverse(m) \* a, it is better to code this using matrix division, as in m \ a. The pre-multiplication case is similar, with b \* inverse(m) being more efficiently coded as as b / m. There are also useful special cases for triangular and symmetric, positive-definite matrices that use more efficient solvers.

**Warning:** The function inv(m) is the elementwise inverse function, which returns 1 / m[i, j] for each element.

**matrix inverse(matrix A)**
Compute the inverse of A
*Available since 2.0*

**matrix inverse_spd(matrix A)**
Compute the inverse of A where A is symmetric, positive definite. This version is faster and more arithmetically stable when the input is symmetric and positive definite.
*Available since 2.0*

**matrix chol2inv(matrix L)**
Compute the inverse of the matrix whose cholesky factorization is L. That is, for A = LL^T, return A^{-1}.
*Available since 2.26*

**Generalized Inverse**
The generalized inverse M^+ of a matrix M is a matrix that satisfies MM^+M = M. For an invertible, square matrix M, M^+ is equivalent to M^{-1}. The dimensions of M^+ are equivalent to the dimensions of M^T. The generalized inverse exists for any matrix, so the M may be singular or less than full rank.

Even though the generalized inverse exists for any arbitrary matrix, the derivatives of this function only exist on matrices of locally constant rank (Golub and Pereyra 1973), meaning, the derivatives do not exist if small perturbations make the matrix change rank. For example, considered the rank of the matrix A as a function of \( \epsilon \):

\[
A = \begin{pmatrix}
1 + \epsilon & 2 & 1 \\
2 & 4 & 2
\end{pmatrix}
\]

When \( \epsilon = 0 \), A is rank 1 because the second row is twice the first (and so there is only one linearly independent row). If \( \epsilon \neq 0 \), the rows are no longer linearly dependent, and the matrix is rank 2. This matrix does not have locally constant rank at \( \epsilon = 0 \), and so the derivatives do not exist at zero. Because HMC depends on the derivatives existing, this lack of differentiability creates undefined behavior.
matrix `generalized_inverse(matrix A)`
The generalized inverse of A

*Available since 2.26*

**Eigendecomposition**

complex_vector `eigenvalues(matrix A)`
The complex-valued vector of eigenvalues of the matrix A. The eigenvalues are repeated according to their algebraic multiplicity, so there are as many eigenvalues as rows in the matrix. The eigenvalues are not sorted in any particular order.

*Available since 2.30*

complex_matrix `eigenvectors(matrix A)`
The matrix with the complex-valued (column) eigenvectors of the matrix A in the same order as returned by the function `eigenvalues`

*Available since 2.30*

tuple(complex_matrix, complex_vector) `eigendecompose(matrix A)`
Return the matrix of (column) eigenvectors and vector of eigenvalues of the matrix A. This function is equivalent to `(eigenvectors(A), eigenvalues(A))` but with a lower computational cost due to the shared work between the two results.

*Available since 2.33*

vector `eigenvalues_sym(matrix A)`
The vector of eigenvalues of a symmetric matrix A in ascending order

*Available since 2.0*

matrix `eigenvectors_sym(matrix A)`
The matrix with the (column) eigenvectors of symmetric matrix A in the same order as returned by the function `eigenvalues_sym`

*Available since 2.0*

tuple(matrix, vector) `eigendecompose_sym(matrix A)`
Return the matrix of (column) eigenvectors and vector of eigenvalues of the symmetric matrix A. This function is equivalent to `(eigenvectors_sym(A), eigenvalues_sym(A))` but with a lower computational cost due to the shared work between the two results.

*Available since 2.33*

Because multiplying an eigenvector by $-1$ results in an eigenvector, eigenvectors returned by a decomposition are only identified up to a sign change. In order to compare the eigenvectors produced by Stan’s eigendecomposition to others, signs may need to be normalized in some way, such as by fixing the sign of a component, or doing comparisons allowing a multiplication by $-1$. 

The condition number of a symmetric matrix is defined to be the ratio of the largest eigenvalue to the smallest eigenvalue. Large condition numbers lead to difficulty in numerical algorithms such as computing inverses, and thus known as “ill conditioned.” The ratio can even be infinite in the case of singular matrices (i.e., those with eigenvalues of 0).

**QR decomposition**

- **matrix qr_thin_Q(matrix A)**
  - The orthogonal matrix in the thin QR decomposition of A, which implies that the resulting matrix has the same dimensions as A
  - *Available since 2.18*

- **matrix qr_thin_R(matrix A)**
  - The upper triangular matrix in the thin QR decomposition of A, which implies that the resulting matrix is square with the same number of columns as A
  - *Available since 2.18*

- **tuple(matrix, matrix) qr_thin(matrix A)**
  - Returns both portions of the QR decomposition of A. The first element (“Q”) is the orthonormal matrix in the thin QR decomposition and the second element (“R”) is upper triangular. This function is equivalent to (qr_thin_Q(A), qr_thin_R(A)) but with a lower computational cost due to the shared work between the two results.
  - *Available since 2.33*

- **matrix qr_Q(matrix A)**
  - The orthogonal matrix in the fat QR decomposition of A, which implies that the resulting matrix is square with the same number of rows as A
  - *Available since 2.3*

- **matrix qr_R(matrix A)**
  - The upper trapezoidal matrix in the fat QR decomposition of A, which implies that the resulting matrix will be rectangular with the same dimensions as A
  - *Available since 2.3*

- **tuple(matrix, matrix) qr(matrix A)**
  - Returns both portions of the QR decomposition of A. The first element (“Q”) is the orthonormal matrix in the thin QR decomposition and the second element (“R”) is upper triangular. This function is equivalent to (qr_Q(A), qr_R(A)) but with a lower computational cost due to the shared work between the two results.
  - *Available since 2.33*

The thin QR decomposition is always preferable because it will consume much less
memory when the input matrix is large than will the fat QR decomposition. Both versions of the decomposition represent the input matrix as

\[ A = QR. \]

Multiplying a column of an orthogonal matrix by \(-1\) still results in an orthogonal matrix, and you can multiply the corresponding row of the upper trapezoidal matrix by \(-1\) without changing the product. Thus, Stan adopts the normalization that the diagonal elements of the upper trapezoidal matrix are strictly positive and the columns of the orthogonal matrix are reflected if necessary. Also, these QR decomposition algorithms do not utilize pivoting and thus may be numerically unstable on input matrices that have less than full rank.

**Cholesky decomposition**

Every symmetric, positive-definite matrix (such as a correlation or covariance matrix) has a Cholesky decomposition. If \( \Sigma \) is a symmetric, positive-definite matrix, its Cholesky decomposition is the lower-triangular vector \( L \) such that

\[ \Sigma = LL^\top. \]

**matrix** `cholesky_decompose(matrix A)`  
The lower-triangular Cholesky factor of the symmetric positive-definite matrix \( A \)

*Available since 2.0*

**Singular value decomposition**

The matrix \( A \) can be decomposed into a diagonal matrix of singular values, \( D \), and matrices of its left and right singular vectors, \( U \) and \( V \),

\[ A = UDV^T. \]

The matrices of singular vectors here are thin. That is for an \( N \) by \( P \) input \( A \), \( M = min(N,P) \), \( U \) is size \( N \) by \( M \) and \( V \) is size \( P \) by \( M \).

**vector** `singular_values(matrix A)`  
The singular values of \( A \) in descending order

*Available since 2.0*

**matrix** `svd_U(matrix A)`  
The left-singular vectors of \( A \)

*Available since 2.26*

**matrix** `svd_V(matrix A)`  
The right-singular vectors of \( A \)

*Available since 2.26*
6.15. Sort functions

See the sorting functions section for examples of how the functions work.

vector `sort_asc`(vector v)
Sort the elements of v in ascending order
Available since 2.0

row_vector `sort_asc`(row_vector v)
Sort the elements of v in ascending order
Available since 2.0

vector `sort_desc`(vector v)
Sort the elements of v in descending order
Available since 2.0

row_vector `sort_desc`(row_vector v)
Sort the elements of v in descending order
Available since 2.0

array[](int) `sort_indices_asc`(vector v)
Return an array of indices between 1 and the size of v, sorted to index v in ascending order.
Available since 2.3

array[](int) `sort_indices_asc`(row_vector v)
Return an array of indices between 1 and the size of v, sorted to index v in ascending order.
Available since 2.3

array[](int) `sort_indices_desc`(vector v)
Return an array of indices between 1 and the size of v, sorted to index v in descending order.
Available since 2.3

array[](int) `sort_indices_desc`(row_vector v)
Return an array of indices between 1 and the size of v, sorted to index v in descend-
CHAPTER 6. MATRIX OPERATIONS

...ing order.

*Available since 2.3*

```c
int rank(vector v, int s)
```
Number of components of \( v \) less than \( v[s] \)

*Available since 2.0*

```c
int rank(row_vector v, int s)
```
Number of components of \( v \) less than \( v[s] \)

*Available since 2.0*

### 6.16. Reverse functions

```c
vector reverse(vector v)
```
Return a new vector containing the elements of the argument in reverse order.

*Available since 2.23*

```c
row_vector reverse(row_vector v)
```
Return a new row vector containing the elements of the argument in reverse order.

*Available since 2.23*
7. Complex Matrix Operations

7.1. Complex promotion

This chapter provides the details of functions that operate over complex matrices, vectors, and row vectors. These mirror the operations over real complex_matrix types and are defined in the usual way for complex numbers.

Promotion of complex arguments

If an expression e can be assigned to a variable of type T, then it can be used as an argument to a function that is specified to take arguments of type T. For instance, sqrt(real) is specified to take a real argument, but an integer expression such as 2 + 2 of type int can be passed to sqrt, so that sqrt(2 + 2) is well defined. This works by promoting the integer expression 2 + 2 to be of real type.

The rules for promotion in Stan are simple:

- int may be promoted to real,
- real may be promoted to complex,
- vector can be promoted to complex_vector,
- row_vector can be promoted to complex_row_vector,
- matrix can be promoted to complex_matrix,
- if T can be promoted to U and U can be promoted to V, then T can be promoted to V (transitive), and
- if T can be promoted to U, then T[] can be promoted to U[] (covariant).

Signature selection

When a function is called, the definition requiring the fewest number of promotions is used. For example, when calling vector + vector, the real-valued signature is used. When calling any of complex_vector + vector, vector + complex_vector, or complex_vector + complex_vector, the complex signature is used. If more than one signature matches with the minimal number of promotions, the call is ambiguous, and an error will be raised by the compiler. Promotion ambiguity leading to ill-defined calls should never happen with Stan built-in functions.

Signatures for complex functions

Complex function signatures will only list the fully complex type. For example, with complex vector addition, we will list a single signature, complex operator+(complex_vector, complex_vector). Through promotion, operator+ may
be called with one complex vector and one real vector as well, but the document-
tation elides the implied signatures operator+(complex_vector, vector) and
operator+(vector, complex_vector).

**Generic functions work for complex containers**

Generic functions work for arrays containing complex, complex matrix, complex
vector, or complex row vector types. This includes the functions append_array,
dims, head, num_elements, rep_array, reverse, segment, size, and tail.

### 7.2. Integer-valued complex matrix size functions

```c
int num_elements(complex_vector x)
The total number of elements in the vector x (same as function rows)
Available since 2.30
```

```c
int num_elements(complex_row_vector x)
The total number of elements in the vector x (same as function cols)
Available since 2.30
```

```c
int num_elements(complex_matrix x)
The total number of elements in the matrix x. For example, if x is a 5 × 3 matrix,
then num_elements(x) is 15
Available since 2.30
```

```c
int rows(complex_vector x)
The number of rows in the vector x
Available since 2.30
```

```c
int rows(complex_row_vector x)
The number of rows in the row vector x, namely 1
Available since 2.30
```

```c
int rows(complex_matrix x)
The number of rows in the matrix x
Available since 2.30
```

```c
int cols(complex_vector x)
The number of columns in the vector x, namely 1
Available since 2.30
```

```c
int cols(complex_row_vector x)
The number of columns in the row vector x
Available since 2.30
```
7.3. COMPLEX MATRIX ARITHMETIC OPERATORS

int **cols**(complex_matrix **x**)  
The number of columns in the matrix **x**  
*Available since 2.30*

int **size**(complex_vector **x**)  
The size of **x**, i.e., the number of elements  
*Available since 2.30*

int **size**(complex_row_vector **x**)  
The size of **x**, i.e., the number of elements  
*Available since 2.30*

int **size**(matrix **x**)  
The size of the matrix **x**. For example, if **x** is a $5 \times 3$ matrix, then **size**(**x**) is 15.  
*Available since 2.30*

### 7.3. Complex matrix arithmetic operators

Stan supports all basic complex arithmetic operators using infix, prefix and postfix operations. This section lists the operations supported by Stan along with their argument and result types.

#### Negation prefix operators

complex_vector **operator**-(complex_vector **x**)  
The negation of the vector **x**.  
*Available since 2.30*

complex_row_vector **operator**-(complex_row_vector **x**)  
The negation of the row vector **x**.  
*Available since 2.30*

complex_matrix **operator**-(complex_matrix **x**)  
The negation of the matrix **x**.  
*Available since 2.30*

T **operator**-(T **x**)  
Vectorized version of **operator**-. If **T** **x** is a (possibly nested) array of matrix types, **-x** is the same shape array where each individual value is negated.  
*Available since 2.31*

#### Infix complex_matrix operators

complex_vector **operator**+(complex_vector **x**, complex_vector **y**)  
The sum of the vectors **x** and **y**.  
*Available since 2.30*
CHAPTER 7. COMPLEX MATRIX OPERATIONS

complex_row_vector operator+(complex_row_vector x, complex_row_vector y)
The sum of the row vectors x and y.
Available since 2.30

complex_matrix operator+(complex_matrix x, complex_matrix y)
The sum of the matrices x and y
Available since 2.30

complex_vector operator-(complex_vector x, complex_vector y)
The difference between the vectors x and y.
Available since 2.30

complex_row_vector operator-(complex_row_vector x, complex_row_vector y)
The difference between the row vectors x and y
Available since 2.30

complex_matrix operator-(complex_matrix x, complex_matrix y)
The difference between the matrices x and y
Available since 2.30

complex_vector operator*(complex x, complex_vector y)
The product of the scalar x and vector y
Available since 2.30

complex_row_vector operator*(complex x, complex_row_vector y)
The product of the scalar x and the row vector y
Available since 2.30

complex_matrix operator*(complex x, complex_matrix y)
The product of the scalar x and the matrix y
Available since 2.30

complex_vector operator*(complex_vector x, complex y)
The product of the scalar y and vector x
Available since 2.30

complex_matrix operator*(complex_vector x, complex_row_vector y)
The product of the vector x and row vector y
Available since 2.30

complex_row_vector operator*(complex_row_vector x, complex y)
The product of the scalar y and row vector x
7.3. COMPLEX MATRIX ARITHMETIC OPERATORS

Available since 2.30

complex operator*(complex_row_vector x, complex_vector y)
The product of the row vector x and vector y
Available since 2.30

complex_row_vector operator*(complex_row_vector x, complex_matrix y)
The product of the row vector x and matrix y
Available since 2.30

complex_matrix operator*(complex_matrix x, complex y)
The product of the scalar y and matrix x
Available since 2.30

complex_vector operator*(complex_matrix x, complex_vector y)
The product of the matrix x and vector y
Available since 2.30

complex_matrix operator*(complex_matrix x, complex_matrix y)
The product of the matrices x and y
Available since 2.30

Broadcast infix operators

complex_vector operator+(complex_vector x, complex y)
The result of adding y to every entry in the vector x
Available since 2.30

complex_vector operator+(complex x, complex_vector y)
The result of adding x to every entry in the vector y
Available since 2.30

complex_row_vector operator+(complex_row_vector x, complex y)
The result of adding y to every entry in the row vector x
Available since 2.30

complex_row_vector operator+(complex x, complex_row_vector y)
The result of adding x to every entry in the row vector y
Available since 2.30

complex_matrix operator+(complex_matrix x, complex y)
The result of adding y to every entry in the matrix x
Available since 2.30
complex_matrix `operator+`(complex x, complex_matrix y)
The result of adding x to every entry in the matrix y  
*Available since 2.30*

complex_vector `operator-`(complex_vector x, complex y)
The result of subtracting y from every entry in the vector x  
*Available since 2.30*

complex_vector `operator-`(complex x, complex_vector y)
The result of adding x to every entry in the negation of the vector y  
*Available since 2.30*

complex_row_vector `operator-`(complex_row_vector x, complex y)
The result of subtracting y from every entry in the row vector x  
*Available since 2.30*

complex_row_vector `operator-`(complex x, complex_row_vector y)
The result of adding x to every entry in the negation of the row vector y  
*Available since 2.30*

complex_matrix `operator-`(complex_matrix x, complex y)
The result of subtracting y from every entry in the matrix x  
*Available since 2.30*

complex_matrix `operator-`(complex x, complex_matrix y)
The result of adding x to every entry in negation of the matrix y  
*Available since 2.30*

complex_vector `operator/`(complex_vector x, complex y)
The result of dividing each entry in the vector x by y  
*Available since 2.30*

complex_row_vector `operator/`(complex_row_vector x, complex y)
The result of dividing each entry in the row vector x by y  
*Available since 2.30*

complex_matrix `operator/`(complex_matrix x, complex y)
The result of dividing each entry in the matrix x by y  
*Available since 2.30*

### 7.4. Complex Transposition Operator

Complex complex_matrix transposition is represented using a postfix operator.

complex_matrix `operator'`(complex_matrix x)
The transpose of the matrix $x$, written as $x'$

*Available since 2.30*

```
complex_row_vector operator' (complex_vector x)
```

The transpose of the vector $x$, written as $x'$

*Available since 2.30*

```
complex_vector operator' (complex_row_vector x)
```

The transpose of the row vector $x$, written as $x'$

*Available since 2.30*

### 7.5. Complex elementwise functions

As in the real case, elementwise complex functions apply a function to each element of a vector or matrix, returning a result of the same shape as the argument.

```
complex_vector operator.* (complex_vector x, complex_vector y)
```

The elementwise product of $x$ and $y$

*Available since 2.30*

```
complex_row_vector operator.* (complex_row_vector x, complex_row_vector y)
```

The elementwise product of $x$ and $y$

*Available since 2.30*

```
complex_matrix operator.* (complex_matrix x, complex_matrix y)
```

The elementwise product of $x$ and $y$

*Available since 2.30*

```
complex_vector operator./ (complex_vector x, complex_vector y)
```

The elementwise quotient of $x$ and $y$

*Available since 2.30*

```
complex_vector operator./ (complex x, complex_vector y)
```

The elementwise quotient of $x$ and $y$

*Available since 2.30*

```
complex_vector operator./ (complex_vector x, complex y)
```

The elementwise quotient of $x$ and $y$

*Available since 2.30*

```
complex_row_vector operator./ (complex_row_vector x, complex_row_vector y)
```

The elementwise quotient of $x$ and $y$

*Available since 2.30*
complex_row_vector operator./(complex x, complex_row_vector y)
The elementwise quotient of x and y
Available since 2.30

complex_row_vector operator./(complex_row_vector x, complex y)
The elementwise quotient of x and y
Available since 2.30

complex_matrix operator./(complex_matrix x, complex_matrix y)
The elementwise quotient of x and y
Available since 2.30

complex_matrix operator./(complex x, complex_matrix y)
The elementwise quotient of x and y
Available since 2.30

complex_matrix operator./(complex_matrix x, complex y)
The elementwise quotient of x and y
Available since 2.30

vector operator.^(complex_vector x, complex_vector y)
The elementwise power of y and x
Available since 2.30

vector operator.^(complex_vector x, complex y)
The elementwise power of y and x
Available since 2.30

vector operator.^(complex x, complex_vector y)
The elementwise power of y and x
Available since 2.30

row_vector operator.^(complex_row_vector x, complex_row_vector y)
The elementwise power of y and x
Available since 2.30

row_vector operator.^(complex_row_vector x, complex y)
The elementwise power of y and x
Available since 2.30

row_vector operator.^(complex x, complex_row_vector y)
The elementwise power of y and x
Available since 2.30
7.6. DOT PRODUCTS AND SPECIALIZED PRODUCTS FOR COMPLEX MATRICES

matrix operator.\(^{\wedge}\) (complex_matrix x, complex_matrix y)
The elementwise power of y and x
Available since 2.30

matrix operator.\(^{\wedge}\) (complex_matrix x, complex y)
The elementwise power of y and x
Available since 2.30

matrix operator.\(^{\wedge}\) (complex x, complex_matrix y)
The elementwise power of y and x
Available since 2.30

7.6. Dot products and specialized products for complex matrices

complex dot_product (complex_vector x, complex_vector y)
The dot product of x and y
Available since 2.30

complex dot_product (complex_vector x, complex_row_vector y)
The dot product of x and y
Available since 2.30

complex dot_product (complex_row_vector x, complex_vector y)
The dot product of x and y
Available since 2.30

complex dot_product (complex_row_vector x, complex_row_vector y)
The dot product of x and y
Available since 2.30

complex_row_vector columns_dot_product (complex_vector x, complex_vector y)
The dot product of the columns of x and y
Available since 2.30

complex_row_vector columns_dot_product (complex_row_vector x, complex_row_vector y)
The dot product of the columns of x and y
Available since 2.30

complex_row_vector columns_dot_product (complex_matrix x, complex_matrix y)
The dot product of the columns of x and y
Available since 2.30
complex_vector **rows_dot_product**(complex_vector x, complex_vector y)
The dot product of the rows of x and y
*Available since 2.30*

complex_vector **rows_dot_product**(complex_row_vector x, complex_row_vector y)
The dot product of the rows of x and y
*Available since 2.30*

complex_vector **rows_dot_product**(complex_matrix x, complex_matrix y)
The dot product of the rows of x and y
*Available since 2.30*

complex **dot_self**(complex_vector x)
The dot product of the vector x with itself
*Available since 2.30*

complex **dot_self**(complex_row_vector x)
The dot product of the row vector x with itself
*Available since 2.30*

complex_row_vector **columns_dot_self**(complex_vector x)
The dot product of the columns of x with themselves
*Available since 2.30*

complex_row_vector **columns_dot_self**(complex_row_vector x)
The dot product of the columns of x with themselves
*Available since 2.30*

complex_row_vector **columns_dot_self**(complex_matrix x)
The dot product of the columns of x with themselves
*Available since 2.30*

complex_vector **rows_dot_self**(complex_vector x)
The dot product of the rows of x with themselves
*Available since 2.30*

complex_vector **rows_dot_self**(complex_row_vector x)
The dot product of the rows of x with themselves
*Available since 2.30*

complex_vector **rows_dot_self**(complex_matrix x)
The dot product of the rows of x with themselves
*Available since 2.30*
Specialized products

complex_matrix \texttt{diag\_pre\_multiply}(\text{complex\_vector} \textit{v}, \text{complex\_matrix} \textit{m})

Return the product of the diagonal matrix formed from the vector \textit{v} and the matrix \textit{m}, i.e., \texttt{diag\_matrix(v)} * \textit{m}.

Available since 2.30

complex_matrix \texttt{diag\_pre\_multiply}(\text{complex\_row\_vector} \textit{v}, \text{complex\_matrix} \textit{m})

Return the product of the diagonal matrix formed from the vector \textit{rv} and the matrix \textit{m}, i.e., \texttt{diag\_matrix(rv)} * \textit{m}.

Available since 2.30

complex_matrix \texttt{diag\_post\_multiply}(\text{complex\_matrix} \textit{m}, \text{complex\_vector} \textit{v})

Return the product of the matrix \textit{m} and the diagonal matrix formed from the vector \textit{v}, i.e., \textit{m} * \texttt{diag\_matrix(v)}.

Available since 2.30

complex_matrix \texttt{diag\_post\_multiply}(\text{complex\_matrix} \textit{m}, \text{complex\_row\_vector} \textit{v})

Return the product of the matrix \textit{m} and the diagonal matrix formed from the row vector \textit{rv}, i.e., \textit{m} * \texttt{diag\_matrix(rv)}.

Available since 2.30

7.7. Complex reductions

Sums and products

complex \texttt{sum}(\text{complex\_vector} \textit{x})

The sum of the values in \textit{x}, or 0 if \textit{x} is empty

Available since 2.30

complex \texttt{sum}(\text{complex\_row\_vector} \textit{x})

The sum of the values in \textit{x}, or 0 if \textit{x} is empty

Available since 2.30

complex \texttt{sum}(\text{complex\_matrix} \textit{x})

The sum of the values in \textit{x}, or 0 if \textit{x} is empty

Available since 2.30

complex \texttt{prod}(\text{complex\_vector} \textit{x})

The product of the values in \textit{x}, or 1 if \textit{x} is empty

Available since 2.30
complex prod(complex_row_vector x)
The product of the values in x, or 1 if x is empty

Available since 2.30

complex prod(complex_matrix x)
The product of the values in x, or 1 if x is empty

Available since 2.30

7.8. Vectorized accessor functions

Much like with complex scalars, two functions are defined to get the real and imaginary components of complex-valued objects.

Type “demotion”

These functions return the same shape (e.g., matrix, vector, row vector, or array) object as their input, but demoted to a real type. For example, get_real(complex_matrix M) yields a matrix containing the real component of each value in M.

The following table contains examples of what this notation can mean:

<table>
<thead>
<tr>
<th>Type T</th>
<th>Type T_demoted</th>
</tr>
</thead>
<tbody>
<tr>
<td>complex</td>
<td>real</td>
</tr>
<tr>
<td>complex_vector</td>
<td>vector</td>
</tr>
<tr>
<td>complex_row_vector</td>
<td>row_vector</td>
</tr>
<tr>
<td>complex_matrix</td>
<td>matrix</td>
</tr>
<tr>
<td>array[] complex</td>
<td>array[] real</td>
</tr>
<tr>
<td>array[][,] complex</td>
<td>array[][,] real</td>
</tr>
</tbody>
</table>

Real and imaginary component accessor functions

T_demoted get_real(T x)
Given an object of complex type T, return the same shape object but of type real by getting the real component of each element of x.

Available since 2.30

T_demoted get_imag(T x)
Given an object of complex type T, return the same shape object but of type real by getting the imaginary component of each element of x.

Available since 2.30

For example, given the Stan declaration
7.9. COMPLEX BROADCAST FUNCTIONS

A call `get_real(z)` will yield the vector `[3, 5]'`, and a call `get_imag(z)` will yield the vector `[4, 6]'`.

7.9. Complex broadcast functions

The following broadcast functions allow vectors, row vectors, and matrices to be created by copying a single element into all of their cells. Matrices may also be created by stacking copies of row vectors vertically or stacking copies of column vectors horizontally.

```c
complex_vector rep_vector(complex z, int m)
Return the size m (column) vector consisting of copies of z.
Available since 2.30
```

```c
complex_row_vector rep_row_vector(complex z, int n)
Return the size n row vector consisting of copies of z.
Available since 2.30
```

```c
complex_matrix rep_matrix(complex z, int m, int n)
Return the m by n matrix consisting of copies of z.
Available since 2.30
```

```c
complex_matrix rep_matrix(complex_vector v, int n)
Return the m by n matrix consisting of n copies of the (column) vector v of size m.
Available since 2.30
```

```c
complex_matrix rep_matrix(complex_row_vector rv, int m)
Return the m by n matrix consisting of m copies of the row vector rv of size n.
Available since 2.30
```

Symmetrization

```c
complex_matrix symmetrize_from_lower_tri(complex_matrix A)
Construct a symmetric matrix from the lower triangle of A.
Available since 2.30
```

7.10. Diagonal complex matrix functions

```c
complex_matrix add_diag(complex_matrix m, complex_row_vector d)
Add row_vector d to the diagonal of matrix m.
Available since 2.30
```

```c
complex_matrix add_diag(complex_matrix m, complex_vector d)
```
Add vector \( \mathbf{d} \) to the diagonal of matrix \( \mathbf{m} \).
*Available since 2.30*

\[
\text{complex_matrix add_diag(complex_matrix m, complex d)}
\]
Add scalar \( \mathbf{d} \) to every diagonal element of matrix \( \mathbf{m} \).
*Available since 2.30*

\[
\text{complex_vector diagonal(complex_matrix x)}
\]
The diagonal of the matrix \( \mathbf{x} \)
*Available since 2.30*

\[
\text{complex_matrix diag_matrix(complex_vector x)}
\]
The diagonal matrix with diagonal \( \mathbf{x} \)
*Available since 2.30*

### 7.11. Slicing and blocking functions for complex matrices
Stan provides several functions for generating slices or blocks or diagonal entries for matrices.

#### Columns and rows

\[
\text{complex_vector col(complex_matrix x, int n)}
\]
The \( n \)-th column of matrix \( \mathbf{x} \)
*Available since 2.30*

\[
\text{complex_row_vector row(complex_matrix x, int m)}
\]
The \( m \)-th row of matrix \( \mathbf{x} \)
*Available since 2.30*

#### Block operations

*Matrix slicing operations*

\[
\text{complex_matrix block(complex_matrix x, int i, int j, int n_rows, int n_cols)}
\]
Return the submatrix of \( \mathbf{x} \) that starts at row \( i \) and column \( j \) and extends \( n \)-rows rows and \( n \)-cols columns.
*Available since 2.30*

\[
\text{complex_vector sub_col(complex_matrix x, int i, int j, int n_rows)}
\]
Return the sub-column of \( \mathbf{x} \) that starts at row \( i \) and column \( j \) and extends \( n \)-rows rows and 1 column.
*Available since 2.30*

\[
\text{complex_row_vector sub_row(complex_matrix x, int i, int j, int n_cols)}
\]
7.12. **COMPLEX MATRIX CONCATENATION**

Return the sub-row of x that starts at row i and column j and extends 1 row and n_cols columns.

*Available since 2.30*

**Vector slicing operations.**

`complex_vector head(complex_vector v, int n)`
Return the vector consisting of the first n elements of v.

*Available since 2.30*

`complex_row_vector head(complex_row_vector rv, int n)`
Return the row vector consisting of the first n elements of rv.

*Available since 2.30*

`complex_vector tail(complex_vector v, int n)`
Return the vector consisting of the last n elements of v.

*Available since 2.30*

`complex_row_vector tail(complex_row_vector rv, int n)`
Return the row vector consisting of the last n elements of rv.

*Available since 2.30*

`complex_vector segment(complex_vector v, int i, int n)`
Return the vector consisting of the n elements of v starting at i; i.e., elements i through through i + n - 1.

*Available since 2.30*

`complex_row_vector segment(complex_row_vector rv, int i, int n)`
Return the row vector consisting of the n elements of rv starting at i; i.e., elements i through through i + n - 1.

*Available since 2.30*

### 7.12. Complex matrix concatenation

**Horizontal concatenation**

`complex_matrix append_col(complex_matrix x, complex_matrix y)`
Combine matrices x and y by column. The matrices must have the same number of rows.

*Available since 2.30*

`complex_matrix append_col(complex_matrix x, complex_vector y)`
Combine matrix x and vector y by column. The matrix and the vector must have the same number of rows.

*Available since 2.30*
complex_matrix \texttt{append\_col}(\texttt{complex\_vector} \ x, \texttt{complex\_matrix} \ y) \\
Combine vector \ x and matrix \ y by column. The vector and the matrix must have the same number of rows. \\
\textit{Available since 2.30}

complex_matrix \texttt{append\_col}(\texttt{complex\_vector} \ x, \texttt{complex\_vector} \ y) \\
Combine vectors \ x and \ y by column. The vectors must have the same number of rows. \\
\textit{Available since 2.30}

\texttt{complex\_row\_vector} \texttt{append\_col}(\texttt{complex\_row\_vector} \ x, \texttt{complex\_row\_vector} \ y) \\
Combine row vectors \ x and \ y (of any size) into another row vector by appending \ y to the end of \ x. \\
\textit{Available since 2.30}

\texttt{complex\_row\_vector} \texttt{append\_col}(\texttt{complex} \ x, \texttt{complex\_row\_vector} \ y) \\
Append \ x to the front of \ y, returning another row vector. \\
\textit{Available since 2.30}

\texttt{complex\_row\_vector} \texttt{append\_col}(\texttt{complex\_row\_vector} \ x, \texttt{complex} \ y) \\
Append \ y to the end of \ x, returning another row vector. \\
\textit{Available since 2.30}

**Vertical concatenation**

complex_matrix \texttt{append\_row}(\texttt{complex\_matrix} \ x, \texttt{complex\_matrix} \ y) \\
Combine matrices \ x and \ y by row. The matrices must have the same number of columns. \\
\textit{Available since 2.30}

complex_matrix \texttt{append\_row}(\texttt{complex\_matrix} \ x, \texttt{complex\_row\_vector} \ y) \\
Combine matrix \ x and row vector \ y by row. The matrix and the row vector must have the same number of columns. \\
\textit{Available since 2.30}

complex_matrix \texttt{append\_row}(\texttt{complex\_row\_vector} \ x, \texttt{complex\_matrix} \ y) \\
Combine row vector \ x and matrix \ y by row. The row vector and the matrix must have the same number of columns. \\
\textit{Available since 2.30}

complex_matrix \texttt{append\_row}(\texttt{complex\_row\_vector} \ x, \texttt{complex\_row\_vector} \ y) \\
Combine row vectors \ x and \ y by row. The row vectors must have the same number
7.13. **COMPLEX SPECIAL MATRIX FUNCTIONS**

of columns.

*Available since 2.30*

```cpp
complex_vector append_row(complex_vector x, complex_vector y)
```
Concatenate vectors x and y of any size into another vector.

*Available since 2.30*

```cpp
complex_vector append_row(complex x, complex_vector y)
```
Append x to the top of y, returning another vector.

*Available since 2.30*

```cpp
complex_vector append_row(complex_vector x, complex y)
```
Append y to the bottom of x, returning another vector.

*Available since 2.30*

### 7.13. Complex special matrix functions

#### Fast Fourier transforms

Stan’s fast Fourier transform functions take the standard definition of the discrete Fourier transform (see the definitions below for specifics) and scale the inverse transform by one over dimensionality so that the following identities hold for complex vectors $u$ and $v$,

$$
\text{fft}(\text{inv_fft}(u)) = u \quad \text{inv_fft}(\text{fft}(v)) = v
$$

and in the 2-dimensional case for complex matrices $A$ and $B$,

$$
\text{fft2}(\text{inv_fft2}(A)) = A \quad \text{inv_fft2}(\text{fft2}(B)) = B
$$

Although the FFT functions only accept complex inputs, real vectors and matrices will be promoted to their complex counterparts before applying the FFT functions.

```cpp
complex_vector fft(complex_vector v)
```
Return the discrete Fourier transform of the specified complex vector $v$. If $v \in \mathbb{C}^N$ is a complex vector with $N$ elements and $u = \text{fft}(v)$, then

$$
    u_n = \sum_{m<n} v_m \cdot \exp\left(\frac{-n \cdot m \cdot 2 \cdot \pi \cdot \sqrt{-1}}{N}\right).
$$

*Available since 2.30*

```cpp
complex_matrix fft2(complex_matrix m)
```
Return the 2D discrete Fourier transform of the specified complex matrix $m$. The 2D FFT is defined as the result of applying the FFT to each row and then to each
column.

Available since 2.30

**complex_vector inv_fft(complex_vector u)**

Return the inverse of the discrete Fourier transform of the specified complex vector u. The inverse FFT (this function) is scaled so that \( \text{fft}(\text{inv_fft}(u)) = u \). If \( u \in \mathbb{C}^N \) is a complex vector with \( N \) elements and \( v = \text{fft}^{-1}(u) \), then

\[
v_n = \frac{1}{N} \sum_{m<n} u_m \cdot \exp \left( \frac{n \cdot m \cdot 2 \cdot \pi \cdot \sqrt{-1}}{N} \right).
\]

This only differs from the FFT by the sign inside the exponential and the scaling. The \( \frac{1}{N} \) scaling ensures that \( \text{fft}(\text{inv_fft}(u)) = u \) and \( \text{inv_fft}(\text{fft}(v)) = v \) for complex vectors \( u \) and \( v \).

Available since 2.30

**complex_matrix inv_fft2(complex_matrix m)**

Return the inverse of the 2D discrete Fourier transform of the specified complex matrix \( m \). The 2D inverse FFT is defined as the result of applying the inverse FFT to each row and then to each column. The invertible scaling of the inverse FFT ensures \( \text{fft2}(\text{inv_fft2}(A)) = A \) and \( \text{inv_fft2}(\text{fft2}(B)) = B \).

Available since 2.30

**Cumulative sums**

The cumulative sum of a sequence \( x_1, \ldots, x_N \) is the sequence \( y_1, \ldots, y_N \), where

\[
y_n = \sum_{m=1}^{n} x_m.
\]

**array[] complex cumulative_sum(array[] complex x)**

The cumulative sum of \( x \)

Available since 2.30

**complex_vector cumulative_sum(complex_vector v)**

The cumulative sum of \( v \)

Available since 2.30

**complex_row_vector cumulative_sum(complex_row_vector rv)**

The cumulative sum of \( rv \)

Available since 2.30
7.14. Complex linear algebra functions

Complex matrix division operators and functions
In general, it is much more efficient and also more arithmetically stable to use matrix division than to multiply by an inverse.

Complex matrix division operators

complex_row_vector operator/(complex_row_vector b, complex_matrix A)
The right division of b by A; equivalently b * inverse(A)
*Available since 2.30*

complex_matrix operator/(complex_matrix B, complex_matrix A)
The right division of B by A; equivalently B * inverse(A)
*Available since 2.30*

Linear algebra functions

Trace

complex trace(complex_matrix A)
The trace of A, or 0 if A is empty; A is not required to be diagonal
*Available since 2.30*

Eigendecomposition

complex_vector eigenvalues(complex_matrix A)
The complex-valued vector of eigenvalues of the matrix A. The eigenvalues are repeated according to their algebraic multiplicity, so there are as many eigenvalues as rows in the matrix. The eigenvalues are not sorted in any particular order.
*Available since 2.32*

complex_matrix eigenvectors(complex_matrix A)
The matrix with the complex-valued (column) eigenvectors of the matrix A in the same order as returned by the function eigenvalues
*Available since 2.32*

tuple(complex_matrix, complex_vector) eigendecompose(complex_matrix A)
Return the matrix of (column) eigenvectors and vector of eigenvalues of the matrix A. This function is equivalent to (eigenvectors(A), eigenvalues(A)) but with a lower computational cost due to the shared work between the two results.
*Available since 2.33*

complex_vector eigenvalues_sym(complex_matrix A)
The vector of eigenvalues of a symmetric matrix A in ascending order
CHAPTER 7. COMPLEX MATRIX OPERATIONS

Available since 2.30

**complex_matrix eigenvectors_sym(complex_matrix A)**
The matrix with the (column) eigenvectors of symmetric matrix A in the same order as returned by the function eigenvalues_sym

*Available since 2.30*

tuple(complex_matrix, complex_vector) **eigendecompose_sym(complex_matrix A)**
Return the matrix of (column) eigenvectors and vector of eigenvalues of the symmetric matrix A. This function is equivalent to (eigenvectors_sym(A), eigenvalues_sym(A)) but with a lower computational cost due to the shared work between the two results.

*Available since 2.33*

Because multiplying an eigenvector by $-1$ results in an eigenvector, eigenvectors returned by a decomposition are only identified up to a sign change. In order to compare the eigenvectors produced by Stan’s eigendecomposition to others, signs may need to be normalized in some way, such as by fixing the sign of a component, or doing comparisons allowing a multiplication by $-1$.

The condition number of a symmetric matrix is defined to be the ratio of the largest eigenvalue to the smallest eigenvalue. Large condition numbers lead to difficulty in numerical algorithms such as computing inverses, and thus known as “ill conditioned.” The ratio can even be infinite in the case of singular matrices (i.e., those with eigenvalues of 0).

**Singular value decomposition**
The matrix A can be decomposed into a diagonal matrix of singular values, D, and matrices of its left and right singular vectors, U and V,

$$A = UDV^T.$$  

The matrices of singular vectors here are thin. That is for an $N$ by $P$ input A, $M = \min(N, P)$, U is size $N$ by $M$ and V is size $P$ by $M$.

**vector singular_values(complex_matrix A)**
The singular values of A in descending order

*Available since 2.30*

**complex_matrix svd_U(complex_matrix A)**
The left-singular vectors of A

*Available since 2.30*
complex_matrix **svd_V**(complex_matrix A)
The right-singular vectors of A
*Available since 2.30*

tuple(complex_matrix, vector, complex_matrix) **svd**(complex_matrix A)
Returns a tuple containing the left-singular vectors of A, the singular values of A in
descending order, and the right-singular values of A. This function is equivalent to
(svd_U(A), singular_values(A), svd_V(A)) but with a lower computational
cost due to the shared work between the different components.
*Available since 2.33*

**Complex Schur Decomposition**
The complex Schur decomposition of a square matrix $A$ produces a complex unitary
matrix $U$ and a complex upper-triangular Schur form matrix $T$ such that

$$A = U \cdot T \cdot U^{-1}$$

Since $U$ is unitary, its inverse is also its conjugate transpose, $U^{-1} = U^*, U^*(i,j) =
\text{conj}(U(j,i))$

complex_matrix **complex_schur_decompose_t**(matrix A)
Compute the upper-triangular Schur form matrix of the complex Schur decomposi-
tion of A.
*Available since 2.31*

complex_matrix **complex_schur_decompose_t**(complex_matrix A)
Compute the upper-triangular Schur form matrix of the complex Schur decomposi-
tion of A.
*Available since 2.31*

complex_matrix **complex_schur_decompose_u**(matrix A)
Compute the unitary matrix of the complex Schur decomposition of A.
*Available since 2.31*

complex_matrix **complex_schur_decompose_u**(complex_matrix A)
Compute the unitary matrix of the complex Schur decomposition of A.
*Available since 2.31*

tuple(complex_matrix, complex_matrix) **complex_schur_decompose**(matrix A)
Returns the unitary matrix and the upper-triangular Schur form matrix of
the complex Schur decomposition of A. This function is equivalent to (**com-
plex_schur_decompose_u**(A), **complex_schur_decompose_t**(A)) but with a
lower computational cost due to the shared work between the two results. This overload is equivalent to `complex_schur_decompose(to_complex(A,0))` but is more efficient.

```
Available since 2.33
```

```
tuple(complex_matrix, complex_matrix) complex_schur_decompose(complex_matrix A)
```

Returns the unitary matrix and the upper-triangular Schur form matrix of the complex Schur decomposition of A. This function is equivalent to `(complex_schur_decompose_u(A), complex_schur_decompose_t(A))` but with a lower computational cost due to the shared work between the two results.

```
Available since 2.33
```

### 7.15. Reverse functions for complex matrices

```
complex_vector reverse(complex_vector v)
```

Return a new vector containing the elements of the argument in reverse order.

```
Available since 2.30
```

```
complex_row_vector reverse(complex_row_vector v)
```

Return a new row vector containing the elements of the argument in reverse order.

```
Available since 2.30
```
8. Sparse Matrix Operations

For sparse matrices, for which many elements are zero, it is more efficient to use specialized representations to save memory and speed up matrix arithmetic (including derivative calculations). Given Stan’s implementation, there is substantial space (memory) savings by using sparse matrices. Because of the ease of optimizing dense matrix operations, speed improvements only arise at 90% or even greater sparsity; below that level, dense matrices are faster but use more memory.

Because of this speedup and space savings, it may even be useful to read in a dense matrix and convert it to a sparse matrix before multiplying it by a vector. This chapter covers a very specific form of sparsity consisting of a sparse matrix multiplied by a dense vector.

8.1. Compressed row storage

Sparse matrices are represented in Stan using compressed row storage (CSR). For example, the matrix

\[
A = \begin{bmatrix}
19 & 27 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 52 \\
81 & 0 & 95 & 33 \\
\end{bmatrix}
\]

is translated into a vector of the non-zero real values, read by row from the matrix \(A\),

\[
w(A) = [19 \ 27 \ 52 \ 81 \ 95 \ 33]^T,
\]

an array of integer column indices for the values,

\[
v(A) = [1 \ 2 \ 4 \ 1 \ 3 \ 4],
\]

and an array of integer indices indicating where in \(w(A)\) a given row’s values start,

\[
u(A) = [1 \ 3 \ 3 \ 4 \ 7],
\]

with a padded value at the end to guarantee that

\[
u(A)[n + 1] - u(A)[n]
\]

is the number of non-zero elements in row \(n\) of the matrix (here 2, 0, 1, and 3). Note that because the second row has no non-zero elements both the second and third
elements of \( u(A) \) correspond to the third element of \( w(A) \), which is 52. The values \((w(A), v(A), u(A))\) are sufficient to reconstruct \( A \).

The values are structured so that there is a real value and integer column index for each non-zero entry in the array, plus one integer for each row of the matrix, plus one for padding. There is also underlying storage for internal container pointers and sizes. The total memory usage is roughly \( 12K + M \) bytes plus a small constant overhead, which is often considerably fewer bytes than the \( M \times N \) required to store a dense matrix. Even more importantly, zero values do not introduce derivatives under multiplication or addition, so many storage and evaluation steps are saved when sparse matrices are multiplied.

8.2. Conversion functions

Conversion functions between dense and sparse matrices are provided.

**Dense to sparse conversion**

Converting a dense matrix \( m \) to a sparse representation produces a vector \( w \) and two integer arrays, \( u \) and \( v \).

\[
\text{vector } \texttt{csr\_extract\_w}(\text{matrix } a) \\
\text{Return non-zero values in matrix } a; \text{ see section compressed row storage.} \\
\text{Available since 2.8}
\]

\[
\text{array}[\text{int}] \texttt{csr\_extract\_v}(\text{matrix } a) \\
\text{Return column indices for values in } \texttt{csr\_extract\_w}(a); \text{ see compressed row storage.} \\
\text{Available since 2.8}
\]

\[
\text{array}[\text{int}] \texttt{csr\_extract\_u}(\text{matrix } a) \\
\text{Return array of row starting indices for entries in } \texttt{csr\_extract\_w}(a) \text{ followed by the size of } \texttt{csr\_extract\_w}(a) \text{ plus one; see section compressed row storage.} \\
\text{Available since 2.8}
\]

\[
\text{tuple(vector, array}[\text{int}] , array}[\text{int}] ) \texttt{csr\_extract}(\text{matrix } a) \\
\text{Return all three components of the CSR representation of the matrix } a; \text{ see section compressed row storage. This function is equivalent to } \texttt{(csr\_extract\_w}(a), \texttt{csr\_extract\_v}(a), \texttt{csr\_extract\_u}(a)). \\
\text{Available since 2.33}
\]

**Sparse to dense conversion**

To convert a sparse matrix representation to a dense matrix, there is a single function.

\[
\text{matrix } \texttt{csr\_to\_dense\_matrix}(\text{int } m, \text{ int } n, \text{ vector } w, \text{ array}[\text{int}] v,
\]
array[int] u)
Return dense \( m \times n \) matrix with non-zero matrix entries \( w \), column indices \( v \), and row starting indices \( u \); the vector \( w \) and array \( v \) must be the same size (corresponding to the total number of nonzero entries in the matrix), array \( v \) must have index values bounded by \( m \), array \( u \) must have length equal to \( m + 1 \) and contain index values bounded by the number of nonzeros (except for the last entry, which must be equal to the number of nonzeros plus one). See section compressed row storage for more details.

Available since 2.10

8.3. Sparse matrix arithmetic

Sparse matrix multiplication
The only supported operation is the multiplication of a sparse matrix \( A \) and a dense vector \( b \) to produce a dense vector \( A b \). Multiplying a dense row vector \( b \) and a sparse matrix \( A \) can be coded using transposition as

\[
b A = (A^\top b^\top)^\top,
\]

but care must be taken to represent \( A^\top \) rather than \( A \) as a sparse matrix.

vector csr_matrix_times_vector(int m, int n, vector w, array[int] v, array[int] u, vector b)
Multiply the \( m \times n \) matrix represented by values \( w \), column indices \( v \), and row start indices \( u \) by the vector \( b \); see compressed row storage.

Available since 2.18
9. Mixed Operations

These functions perform conversions between Stan containers matrix, vector, row vector and arrays.

- **matrix** `to_matrix` *(matrix m)*
  - Return the matrix `m` itself.
  - Available since 2.3

- **complex_matrix** `to_matrix` *(complex_matrix m)*
  - Return the matrix `m` itself.
  - Available since 2.30

- **matrix** `to_matrix` *(vector v)*
  - Convert the column vector `v` to a `size(v)` by 1 matrix.
  - Available since 2.3

- **complex_matrix** `to_matrix` *(complex_vector v)*
  - Convert the column vector `v` to a `size(v)` by 1 matrix.
  - Available since 2.30

- **matrix** `to_matrix` *(row_vector v)*
  - Convert the row vector `v` to a 1 by `size(v)` matrix.
  - Available since 2.3

- **complex_matrix** `to_matrix` *(complex_row_vector v)*
  - Convert the row vector `v` to a 1 by `size(v)` matrix.
  - Available since 2.30

- **matrix** `to_matrix` *(matrix M, int m, int n)*
  - Convert a matrix `A` to a matrix with `m` rows and `n` columns filled in column-major order.
  - Available since 2.15

- **complex_matrix** `to_matrix` *(complex_matrix M, int m, int n)*
  - Convert a matrix `A` to a matrix with `m` rows and `n` columns filled in column-major order.
  - Available since 2.30

- **matrix** `to_matrix` *(vector v, int m, int n)*
  - Convert a vector `v` to a matrix with `m` rows and `n` columns filled in column-major order.
order.

Available since 2.15

complex_matrix to_matrix(complex_vector v, int m, int n)
Convert a vector v to a matrix with m rows and n columns filled in column-major order.

Available since 2.30

matrix to_matrix(row_vector v, int m, int n)
Convert a row_vector v to a matrix with m rows and n columns filled in column-major order.

Available since 2.15

complex_matrix to_matrix(complex_row_vector v, int m, int n)
Convert a row vector v to a matrix with m rows and n columns filled in column-major order.

Available since 2.30

matrix to_matrix(matrix A, int m, int n, int col_major)
Convert a matrix A to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.15

complex_matrix to_matrix(complex_matrix A, int m, int n, int col_major)
Convert a matrix A to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.30

matrix to_matrix(vector v, int m, int n, int col_major)
Convert a vector v to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.15

complex_matrix to_matrix(complex_vector v, int m, int n, int col_major)
Convert a vector v to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.30

matrix to_matrix(row_vector v, int m, int n, int col_major)
Convert a row vector v to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).
Available since 2.15

complex_matrix to_matrix(complex_row_vector v, int m, int n, int col_major)
Convert a row vector v to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.30

matrix to_matrix(array[] real a, int m, int n)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in column-major order.

Available since 2.15

matrix to_matrix(array[] int a, int m, int n)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in column-major order.

Available since 2.15

complex_matrix to_matrix(array[] complex a, int m, int n)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in column-major order.

Available since 2.30

matrix to_matrix(array[] real a, int m, int n, int col_major)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.15

matrix to_matrix(array[] int a, int m, int n, int col_major)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.15

complex_matrix to_matrix(array[] complex a, int m, int n, int col_major)
Convert a one-dimensional array a to a matrix with m rows and n columns filled in row-major order if col_major equals 0 (otherwise, they get filled in column-major order).

Available since 2.30

matrix to_matrix(array[] row_vector vs)
Convert a one-dimensional array of row vectors to a matrix, where the size of the array is the number of rows of the resulting matrix and the length of row vectors is the number of columns.

*Available since 2.28*

**complex_matrix** `to_matrix(array[] complex_row_vector vs)`

Convert a one-dimensional array of row vectors to a matrix, where the size of the array is the number of rows of the resulting matrix and the length of row vectors is the number of columns.

*Available since 2.30*

**matrix** `to_matrix(array[, ] real a)`

Convert the two dimensional array `a` to a matrix with the same dimensions and indexing order.

*Available since 2.3*

**matrix** `to_matrix(array[, ] int a)`

Convert the two dimensional array `a` to a matrix with the same dimensions and indexing order. If any of the dimensions of `a` are zero, the result will be a 0 \times 0 matrix.

*Available since 2.3*

**complex_matrix** `to_matrix(array[, ] complex a)`

Convert the two dimensional array `a` to a matrix with the same dimensions and indexing order.

*Available since 2.30*

**vector** `to_vector(matrix m)`

Convert the matrix `m` to a column vector in column-major order.

*Available since 2.0*

**complex_vector** `to_vector(complex_matrix m)`

Convert the matrix `m` to a column vector in column-major order.

*Available since 2.30*

**vector** `to_vector(vector v)`

Return the column vector `v` itself.

*Available since 2.3*

**complex_vector** `to_vector(complex_vector v)`

Return the column vector `v` itself.

*Available since 2.30*

**vector** `to_vector(row_vector v)`
Convert the row vector $v$ to a column vector.  
*Available since 2.3*

```cpp
complex_vector to_vector(complex_row_vector v)
```

Convert the row vector $v$ to a column vector.  
*Available since 2.30*

```cpp
vector to_vector(array[] real a)
```
Convert the one-dimensional array $a$ to a column vector.  
*Available since 2.3*

```cpp
vector to_vector(array[] int a)
```
Convert the one-dimensional integer array $a$ to a column vector.  
*Available since 2.3*

```cpp
complex_vector to_vector(array[] complex a)
```
Convert the one-dimensional complex array $a$ to a column vector.  
*Available since 2.30*

```cpp
row_vector to_row_vector(matrix m)
```
Convert the matrix $m$ to a row vector in column-major order.  
*Available since 2.3*

```cpp
complex_row_vector to_row_vector(complex_matrix m)
```
Convert the matrix $m$ to a row vector in column-major order.  
*Available since 2.30*

```cpp
row_vector to_row_vector(vector v)
```
Convert the column vector $v$ to a row vector.  
*Available since 2.3*

```cpp
complex_row_vector to_row_vector(complex_vector v)
```
Convert the column vector $v$ to a row vector.  
*Available since 2.30*

```cpp
row_vector to_row_vector(row_vector v)
```
Return the row vector $v$ itself.  
*Available since 2.3*

```cpp
complex_row_vector to_row_vector(complex_row_vector v)
```
Return the row vector $v$ itself.  
*Available since 2.30*

```cpp
row_vector to_row_vector(array[] real a)
```
Convert the one-dimensional array $a$ to a row vector.
Available since 2.3

\texttt{row\_vector to\_row\_vector(array[\] int a)}
Converting the one-dimensional array \(a\) to a row vector.

Available since 2.3

\texttt{complex\_row\_vector to\_row\_vector(array[\] complex a)}
Converting the one-dimensional complex array \(a\) to a row vector.

Available since 2.30

\texttt{array[,] real to\_array\_2d(matrix m)}
Converting the matrix \(m\) to a two-dimensional array with the same dimensions and indexing order.

Available since 2.3

\texttt{array[,] complex to\_array\_2d(complex\_matrix m)}
Converting the matrix \(m\) to a two-dimensional array with the same dimensions and indexing order.

Available since 2.30

\texttt{array[] real to\_array\_1d(vector v)}
Converting the column vector \(v\) to a one-dimensional array.

Available since 2.3

\texttt{array[] complex to\_array\_1d(complex\_vector v)}
Converting the column vector \(v\) to a one-dimensional array.

Available since 2.30

\texttt{array[] real to\_array\_1d(row\_vector v)}
Converting the row vector \(v\) to a one-dimensional array.

Available since 2.3

\texttt{array[] complex to\_array\_1d(complex\_row\_vector v)}
Converting the row vector \(v\) to a one-dimensional array.

Available since 2.30

\texttt{array[] real to\_array\_1d(matrix m)}
Converting the matrix \(m\) to a one-dimensional array in column-major order.

Available since 2.3

\texttt{array[] real to\_array\_1d(complex\_matrix m)}
Converting the matrix \(m\) to a one-dimensional array in column-major order.

Available since 2.30
array[] real to_array_1d(array[...]) real a
Convert the array a (of any dimension up to 10) to a one-dimensional array in row-major order.
*Available since 2.3*

array[] int to_array_1d(array[...]) int a
Convert the array a (of any dimension up to 10) to a one-dimensional array in row-major order.
*Available since 2.3*

array[] complex to_array_1d(array[...]) complex a
Convert the array a (of any dimension up to 10) to a one-dimensional array in row-major order.
*Available since 2.30*
10. Compound Arithmetic and Assignment

Compound arithmetic and assignment statements combine an arithmetic operation and assignment, replacing a statement such as

\[ x = x \text{ op } y; \]

with the more compact compound form

\[ x \text{ op=} y; \]

For example, \( x = x + 1; \) may be replaced with \( x += 1; \). This works for all types that support arithmetic, including the scalar types int, real, complex, the real matrix types vector, row_vector, and matrix, and the complex matrix types, complex_vector, complex_row_vector, and complex_matrix.

10.1. Compound addition and assignment

Compound addition and assignment works wherever the corresponding addition and assignment would be well formed.

\[
\text{void operator\n\n+=}(\text{T } x, \text{ U } y) \\
x += y \text{ is equivalent to } x = x + y. \text{ Defined for all types } T \text{ and } U \text{ where } T = T + U \text{ is well formed.} \\
\text{Available since 2.17, complex signatures added in 2.30}
\]

10.2. Compound subtraction and assignment

Compound addition and assignment works wherever the corresponding subtraction and assignment would be well formed.

\[
\text{void operator\n-\n=(T } x, \text{ U } y) \\
x -= y \text{ is equivalent to } x = x - y. \text{ Defined for all types } T \text{ and } U \text{ where } T = T - U \text{ is well formed.} \\
\text{Available since 2.17, complex signatures added in 2.30}
\]

10.3. Compound multiplication and assignment

Compound multiplication and assignment works wherever the corresponding multiplication and assignment would be well formed.

\[
\text{void operator\n\n\n\n*=}(\text{T } x, \text{ U } y)
\]
\[ x *= y \] is equivalent to \[ x = x * y \]. Defined for all types \( T \) and \( U \) where \( T = T * U \) is well formed. 

*Available since 2.17, complex signatures added in 2.30*

### 10.4. Compound division and assignment

Compound division and assignment works wherever the corresponding division and assignment would be well formed.

```cpp
void operator/=(T x, U y)
```

\[ x /= y \] is equivalent to \[ x = x / y \]. Defined for all types \( T \) and \( U \) where \( T = T / U \) is well formed. 

*Available since 2.17, complex signatures added in 2.30*

### 10.5. Compound elementwise multiplication and assignment

Compound elementwise multiplication and assignment works wherever the corresponding multiplication and assignment would be well formed.

```cpp
void operator.*=(T x, U y)
```

\[ x .*= y \] is equivalent to \[ x = x .* y \]. Defined for all types \( T \) and \( U \) where \( T = T .* U \) is well formed. 

*Available since 2.17, complex signatures added in 2.30*

### 10.6. Compound elementwise division and assignment

Compound elementwise division and assignment works wherever the corresponding division and assignment would be well formed.

```cpp
void operator./=(T x, U y)
```

\[ x ./= y \] is equivalent to \[ x = x ./ y \]. Defined for all types \( T \) and \( U \) where \( T = T ./ U \) is well formed. 

*Available since 2.17, complex signatures added in 2.30*
11. Higher-Order Functions

Stan provides a few higher-order functions that act on other functions. In all cases, the function arguments to the higher-order functions are defined as functions within the Stan language and passed by name to the higher-order functions.

11.1. Algebraic equation solvers

Stan provides two built-in algebraic equation solvers, respectively based on the Newton method and the Powell “dog leg” hybrid method. Empirically the Newton method is found to be faster and its use is recommended for most problems.

An algebraic solver is a higher-order function, i.e. it takes another function as one of its arguments. Other functions in Stan which share this feature are the differential equation solvers (see section Ordinary Differential Equation (ODE) Solvers and Differential Algebraic Equation (DAE) solver). Ordinary Stan functions do not allow functions as arguments.

Specifying an algebraic equation as a function

An algebraic system is specified as an ordinary function in Stan within the function block. The function must return a vector and takes in, as its first argument, the unknowns \( y \) we wish to solve for, also passed as a vector. This argument is followed by additional arguments as specified by the user; we call such arguments variadic arguments and denote them \( \ldots \). The signature of the algebraic system is then:

```
vector algebra_system (vector y, ...)
```

There is no type restriction for the variadic arguments and each argument can be passed as data or parameter. However users should use parameter arguments only when necessary and mark data arguments with the keyword data. In the below example, the last variadic argument, \( x \), is restricted to being data:

```
vector algebra_system (vector y, vector theta, data vector x)
```

Distinguishing data and parameter is important for computational reasons. Augmenting the total number of parameters increases the cost of propagating derivatives through the solution to the algebraic equation, and ultimately the computational cost of evaluating the gradients.
Call to the algebraic solver

vector \texttt{solve_newton}(function \texttt{algebra\_system}, \texttt{vector \_guess}, ...)  
Solves the algebraic system, given an initial guess, using Newton’s method.  
\textit{Available since 2.31}

vector \texttt{solve_newton\_tol}(function \texttt{algebra\_system}, \texttt{vector \_guess}, \texttt{data real scaling\_step}, \texttt{data real f\_tol}, \texttt{int max\_steps}, ...)  
Solves the algebraic system, given an initial guess, using Newton’s method with additional control parameters for the solver.  
\textit{Available since 2.31}

vector \texttt{solve\_powell}(function \texttt{algebra\_system}, \texttt{vector \_guess}, ...)  
Solves the algebraic system, given an initial guess, using Powell’s hybrid method.  
\textit{Available since 2.31}

vector \texttt{solve\_powell\_tol}(function \texttt{algebra\_system}, \texttt{vector \_guess}, \texttt{data real rel\_tol}, \texttt{data real f\_tol}, \texttt{int max\_steps}, ...)  
Solves the algebraic system, given an initial guess, using Powell’s hybrid method with additional control parameters for the solver.  
\textit{Available since 2.31}

Arguments to the algebraic solver

The arguments to the algebraic solvers are as follows:

- \texttt{algebra\_system}: function literal referring to a function specifying the system of algebraic equations with signature (\texttt{vector, ...}):	exttt{vector}. The arguments represent (1) unknowns, (2) additional parameter and/or data arguments, and the return value contains the value of the algebraic function, which goes to 0 when we plug in the solution to the algebraic system,
- \texttt{\_guess}: initial guess for the solution, type \texttt{vector},
- \texttt{...}: variadic arguments.

The algebraic solvers admit control parameters. While Stan provides default values, the user should be prepared to adjust the control parameters. The following controls are available:

- \texttt{scaling\_step}: for the Newton solver only, the scaled-step stopping tolerance, type \texttt{real}, data only. If a Newton step is smaller than the scaling step tolerance, the code breaks, assuming the solver is no longer making significant progress. If set to 0, this constraint is ignored. Default value is $10^{-3}$.
- \texttt{rel\_tol}: for the Powell solver only, the relative tolerance, type \texttt{real}, data only.
The relative tolerance is the estimated relative error of the solver and serves to test if a satisfactory solution has been found. Default value is $10^{-10}$.

- **function_tol**: function tolerance for the algebraic solver, type `real`, data only. After convergence of the solver, the proposed solution is plugged into the algebraic system and its norm is compared to the function tolerance. If the norm is below the function tolerance, the solution is deemed acceptable. Default value is $10^{-6}$.

- **max_num_steps**: maximum number of steps to take in the algebraic solver, type `int`, data only. If the solver reaches this number of steps, it breaks and returns an error message. Default value is 200.

The difference in which control parameters are available has to do with the underlying implementations for the solvers and the control parameters these implementations support. The Newton solver is based on KINSOL from the SUNDIAL suites, while the Powell solver uses a module from the Eigen library.

**Return value**

The return value for the algebraic solver is an object of type `vector`, with values which, when plugged in as $y$ make the algebraic function go to 0 (approximately, within the specified function tolerance).

**Sizes and parallel arrays**

Certain sizes have to be consistent. The initial guess, return value of the solver, and return value of the algebraic function must all be the same size.

**Algorithmic details**

Stan offers two methods to solve algebraic equations. `solve_newton` and `solve_newton_tol` use the Newton method, a first-order derivative based numerical solver. The Stan code builds on the implementation in KINSOL from the SUNDIALS suite (Hindmarsh et al. 2005). For many problems, we find that the Newton method is faster than the Powell method. If however Newton’s method performs poorly, either failing to or requiring an excessively long time to converge, the user should be prepared to switch to the Powell method.

`solve_powell` and `solve_powell_tol` are based on the Powell hybrid method (Powell 1970), which also uses first-order derivatives. The Stan code builds on the implementation of the hybrid solver in the unsupported module for nonlinear optimization problems of the Eigen library (Guennebaud, Jacob, et al. 2010). This solver is in turn based on the algorithm developed for the package MINPACK-1 (Jorge J. More 1980).
For both solvers, derivatives are propagated through the solution to the algebraic solution using the implicit function theorem and an adjoint method of automatic differentiation; for a discussion on this topic, see (Gaebler 2021) and (Margossian and Betancourt 2022).

11.2. Ordinary differential equation (ODE) solvers

Stan provides several higher order functions for solving initial value problems specified as Ordinary Differential Equations (ODEs).

Solving an initial value ODE means given a set of differential equations \( y'(t, \theta) = f(t, y, \theta) \) and initial conditions \( y(t_0, \theta) \), solving for \( y \) at a sequence of times \( t_0 < t_1 < t_2, \ldots < t_n \). \( f(t, y, \theta) \) is referred to here as the ODE system function.

\( f(t, y, \theta) \) will be defined as a function with a certain signature and provided along with the initial conditions and output times to one of the ODE solver functions.

To make it easier to write ODEs, the solve functions take extra arguments that are passed along unmodified to the user-supplied system function. Because there can be any number of these arguments and they can be of different types, they are denoted below as \( \ldots \). The types of the arguments represented by \( \ldots \) in the ODE solve function call must match the types of the arguments represented by \( \ldots \) in the user-supplied system function.

### Non-stiff solver

array[] vector \texttt{ode\_rk45}\( (\text{function ode, vector initial\_state, real initial\_time, array[] real times, ...}) \)

Solves the ODE system for the times provided using the Dormand-Prince algorithm, a 4th/5th order Runge-Kutta method.

*Available since 2.24*

array[] vector \texttt{ode\_rk45\_tol}\( (\text{function ode, vector initial\_state, real initial\_time, array[] real times, data real rel\_tol, data real abs\_tol, int max\_num\_steps, ...}) \)

Solves the ODE system for the times provided using the Dormand-Prince algorithm, a 4th/5th order Runge-Kutta method with additional control parameters for the solver.

*Available since 2.24*

array[] vector \texttt{ode\_ckrk}\( (\text{function ode, vector initial\_state, real initial\_time, array[] real times, ...}) \)

Solves the ODE system for the times provided using the Cash-Karp algorithm, a 4th/5th order explicit Runge-Kutta method.
Available since 2.27

array[] vector  
ode_ckrk_tol(function ode, vector initial_state, 
real initial_time, array[] real times, data real rel_tol, data 
real abs_tol, int max_num_steps, ...)

Solves the ODE system for the times provided using the Cash-Karp algorithm, a 
4th/5th order explicit Runge-Kutta method with additional control parameters for 
the solver.

Available since 2.27

array[] vector  
ode_adams(function ode, vector initial_state, real 
initial_time, array[] real times, ...)

Solves the ODE system for the times provided using the Adams-Moulton method.

Available since 2.24

array[] vector  
ode_adams_tol(function ode, vector initial_state, 
real initial_time, array[] real times, data real rel_tol, data 
real abs_tol, int max_num_steps, ...)

Solves the ODE system for the times provided using the Adams-Moulton method 
with additional control parameters for the solver.

Available since 2.24

Stiff solver

array[] vector  
ode_bdf(function ode, vector initial_state, real 
initial_time, array[] real times, ...)

Solves the ODE system for the times provided using the backward differentiation 
formula (BDF) method.

Available since 2.24

array[] vector  
node_bdf_tol(function ode, vector initial_state, real 
initial_time, array[] real times, data real rel_tol, data real 
abs_tol, int max_num_steps, ...)

Solves the ODE system for the times provided using the backward differentiation 
formula (BDF) method with additional control parameters for the solver.

Available since 2.24

Adjoint solver

array[] vector  
node_adjoint_tol_ctl(function ode, vector ini-
tial_state, real initial_time, array[] real times, data real 
rel_tol_forward, data vector abs_tol_forward, data real 
rel_tol_backward, data vector abs_tol_backward, int max_num_steps, 
int num_steps_between_checkpoints, int interpolation_polynomial,
int solver_forward, int solver_backward, ...)

Solves the ODE system for the times provided using the adjoint ODE solver method from CVODES. The adjoint ODE solver requires a checkpointed forward in time ODE integration, a backwards in time integration that makes uses of an interpolated version of the forward solution, and the solution of a quadrature problem (the number of which depends on the number of parameters passed to the solve). The tolerances and numeric methods used for the forward solve, backward solve, quadratures, and interpolation can all be configured.

Available since 2.27

ODE system function
The first argument to one of the ODE solvers is always the ODE system function. The ODE system function must have a vector return type, and the first two arguments must be a real and vector in that order. These two arguments are followed by the variadic arguments that are passed through from the ODE solve function call:

```c
vector ode(real time, vector state, ...)
```

The ODE system function should return the derivative of the state with respect to time at the time and state provided. The length of the returned vector must match the length of the state input into the function.

The arguments to this function are:

- `time`, the time to evaluate the ODE system
- `state`, the state of the ODE system at the time specified
- `...`, sequence of arguments passed unmodified from the ODE solve function call. The types here must match the types in the ... arguments of the ODE solve function call.

Arguments to the ODE solvers
The arguments to the ODE solvers in both the stiff and non-stiff solvers are the same. The arguments to the adjoint ODE solver are different; see Arguments to the adjoint ODE solvers.

- `ode`: ODE system function,
- `initial_state`: initial state, type vector,
- `initial_time`: initial time, type real,
• \textit{times}: solution times, type array[] real,

• \ldots: sequence of arguments that will be passed through unmodified to the ODE system function. The types here must match the types in the \ldots arguments of the ODE system function.

For the versions of the ode solver functions ending in \_tol, these three parameters must be provided after \textit{times} and before the \ldots arguments:

• \textit{data rel_tol}: relative tolerance for the ODE solver, type real, data only,

• \textit{data abs_tol}: absolute tolerance for the ODE solver, type real, data only, and

• \textit{max_num_steps}: maximum number of steps to take between output times in the ODE solver, type int, data only.

Because the tolerances are data arguments, they must be defined in either the data or transformed data blocks. They cannot be parameters, transformed parameters or functions of parameters or transformed parameters.

\textbf{Arguments to the adjoint ODE solver}

The arguments to the adjoint ODE solver are different from those for the other functions (for those see Arguments to the adjoint ODE solvers).

• \textit{ode}: ODE system function,

• \textit{initial_state}: initial state, type vector,

• \textit{initial_time}: initial time, type real,

• \textit{times}: solution times, type array[] real,

• \textit{data rel_tol_forward}: Relative tolerance for forward solve, type real, data only,

• \textit{data abs_tol_forward}: Absolute tolerance vector for each state for forward solve, type vector, data only,

• \textit{data rel_tol_backward}: Relative tolerance for backward solve, type real, data only,

• \textit{data abs_tol_backward}: Absolute tolerance vector for each state for backward solve, type vector, data only,

• \textit{data rel_tol_quadrature}: Relative tolerance for backward quadrature, type real, data only,
• data `abs_tol_quadrature`: Absolute tolerance for backward quadrature, type `real`, data only,

• data `max_num_steps`: Maximum number of time-steps to take in integrating the ODE solution between output time points for forward and backward solve, type `int`, data only,

• `num_steps_between_checkpoints`: number of steps between checkpointing forward solution, type `int`, data only,

• `interpolation_polynomial`: can be 1 for hermite or 2 for polynomial interpolation method of CVODES, type `int`, data only,

• `solver_forward`: solver used for forward ODE problem: 1=Adams (non-stiff), 2=BDF (stiff), type `int`, data only,

• `solver_backward`: solver used for backward ODE problem: 1=Adams (non-stiff), 2=BDF (stiff), type `int`, data only.

• ...: sequence of arguments that will be passed through unmodified to the ODE system function. The types here must match the types in the ... arguments of the ODE system function.

Because the tolerances are data arguments, they must be defined in either the data or transformed data blocks. They cannot be parameters, transformed parameters or functions of parameters or transformed parameters.

**Return values**

The return value for the ODE solvers is an array of vectors (type `array[] vector`), one vector representing the state of the system at every time in specified in the `times` argument.

**Array and vector sizes**

The sizes must match, and in particular, the following groups are of the same size:

- state variables passed into the system function, derivatives returned by the system function, initial state passed into the solver, and length of each vector in the output,

- number of solution times and number of vectors in the output.

### 11.3. Differential-Algebraic equation (DAE) solver

Stan provides two higher order functions for solving initial value problems specified as Differential-Algebraic Equations (DAEs) with index-1 (Serban et al. 2021).
11.3. DIFFERENTIAL-ALGEBRAIC EQUATION (DAE) SOLVER

Solving an initial value DAE means given a set of residual functions \( r(y'(t,\theta), y(t,\theta), t) \) and initial conditions \( (y(t_0,\theta), y'(t_0,\theta)) \), solving for \( y \) at a sequence of times \( t_0 < t_1 \leq t_2, \cdots \leq t_n \). The residual function \( r(y',y,t,\theta) \) will be defined as a function with a certain signature and provided along with the initial conditions and output times to one of the DAE solver functions.

Similar to ODE solvers, the DAE solver function takes extra arguments that are passed along unmodified to the user-supplied system function. Because there can be any number of these arguments and they can be of different types, they are denoted below as \( \ldots \), and the types of these arguments, also represented by \( \ldots \) in the DAE solver call, must match the types of the arguments represented by \( \ldots \) in the user-supplied system function.

**The DAE solver**

```c
array[] vector dae(function residual, vector initial_state, vector initial_state_derivative, data real initial_time, data array[] real times, \ldots)
```

Solves the DAE system using the backward differentiation formula (BDF) method (Serban et al. 2021).

*Available since 2.29*

```c
array[] vector dae_tol(function residual, vector initial_state, vector initial_state_derivative, data real initial_time, data array[] real times, data real rel_tol, data real abs_tol, int max_num_steps, \ldots)
```

Solves the DAE system for the times provided using the backward differentiation formula (BDF) method with additional control parameters for the solver.

*Available since 2.29*

**DAE system function**

The first argument to the DAE solver is the DAE residual function. The DAE residual function must have a `vector` return type, and the first three arguments must be a `real`, `vector`, and `vector`, in that order. These three arguments are followed by the variadic arguments that are passed through from the DAE solver function call:

```c
vector residual(real time, vector state, vector state_derivative, \ldots)
```

The DAE residual function should return the residuals at the time and state provided. The length of the returned vector must match the length of the state input into the function.
The arguments to this function are:

- **\textit{time},** the time to evaluate the DAE system
- **\textit{state},** the state of the DAE system at the time specified
- **\textit{state\_derivative},** the time derivatives of the state of the DAE system at the time specified
- \ldots, sequence of arguments passed unmodified from the DAE solve function call. The types here must match the types in the \ldots arguments of the DAE solve function call.

**Arguments to the DAE solver**

The arguments to the DAE solver are

- **\textit{residual}:** DAE residual function,
- **\textit{initial\_state}:** initial state, type vector,
- **\textit{initial\_state\_derivative}:** time derivative of the initial state, type vector,
- **\textit{initial\_time}:** initial time, type data real,
- **\textit{times}:** solution times, type data array[] real,
- \ldots: sequence of arguments that will be passed through unmodified to the DAE residual function. The types here must match the types in the \ldots arguments of the DAE residual function.

For **\textit{dae\_tol},** the following three parameters must be provided after **\textit{times}** and before the \ldots arguments:

- **\textit{data rel\_tol}:** relative tolerance for the DAE solver, type real, data only,
- **\textit{data abs\_tol}:** absolute tolerance for the DAE solver, type real, data only, and
- **\textit{max\_num\_steps}:** maximum number of steps to take between output times in the DAE solver, type int, data only.

Because the tolerances are data arguments, they must be supplied as primitive numerics or defined in either the data or transformed data blocks. They cannot be parameters, transformed parameters or functions of parameters or transformed parameters.
Consistency of the initial conditions
The user is responsible to ensure the residual function becomes zero at the initial time, \(t_0\), when the arguments \text{initial\_state} and \text{initial\_state\_derivative} are introduced as \text{state} and \text{state\_derivative}, respectively.

Return values
The return value for the DAE solvers is an array of vectors (type \text{array[]} \text{vector}), one vector representing the state of the system at every time specified in the \text{times} argument.

Array and vector sizes
The sizes must match, and in particular, the following groups are of the same size:

- state variables and state derivatives passed into the residual function, the residual returned by the residual function, initial state and initial state derivatives passed into the solver, and length of each vector in the output,
- number of solution times and number of vectors in the output.

11.4. 1D integrator
Stan provides a built-in mechanism to perform 1D integration of a function via quadrature methods.

It operates similarly to the algebraic solver and the ordinary differential equations solver in that it allows as an argument a function.

Like both of those utilities, some of the arguments are limited to data only expressions. These expressions must not contain variables other than those declared in the data or transformed data blocks.

Specifying an integrand as a function
Performing a 1D integration requires the integrand to be specified somehow. This is done by defining a function in the Stan functions block with the special signature:

```stan
real integrand(real x, real xc, array[] real theta, array[] real x_r, array[] int x_i)
```

The function should return the value of the integrand evaluated at the point \(x\).

The argument of this function are:

- \(x\), the independent variable being integrated over
- \(xc\), a high precision version of the distance from \(x\) to the nearest endpoint in a definite integral (for more into see section Precision Loss).
• \textit{theta}, parameter values used to evaluate the integral
• \textit{x\_r}, data values used to evaluate the integral
• \textit{x\_i}, integer data used to evaluate the integral

Like algebraic solver and the differential equations solver, the 1D integrator separates parameter values, theta, from data values, \textit{x\_r}.

\textbf{Call to the 1D integrator}

\begin{verbatim}
real integrate_1d (function integrand, real a, real b, array[] real theta, array[] real x_r, array[] int x_i)
Integrates the integrand from a to b.
Available since 2.23
\end{verbatim}

\begin{verbatim}
real integrate_1d (function integrand, real a, real b, array[] real theta, array[] real x_r, array[] int x_i, real relative_tolerance)
Integrates the integrand from a to b with the given relative tolerance.
Available since 2.23
\end{verbatim}

\textbf{Arguments to the 1D integrator}

The arguments to the 1D integrator are as follows:

• \textit{integrand}: function literal referring to a function specifying the integrand with signature \((real, real, array[] real, array[] real, array[] int):real\) The arguments represent
  – (1) where integrand is evaluated,
  – (2) distance from evaluation point to integration limit for definite integrals,
  – (3) parameters,
  – (4) real data
  – (5) integer data, and the return value is the integrand evaluated at the given point,
• \textit{a}: left limit of integration, may be negative infinity, type real,
• \textit{b}: right limit of integration, may be positive infinity, type real,
• \textit{theta}: parameters only, type array[] real,
• \textit{x\_r}: real data only, type array[] real,
• \textit{x\_i}: integer data only, type array[] int.

A \textit{relative\_tolerance} argument can optionally be provided for more control over the algorithm:

• \textit{relative\_tolerance}: relative tolerance for the 1d integrator, type real, data only.
Return value
The return value for the 1D integrator is a real, the value of the integral.

Zero-crossing integrals
For numeric stability, integrals on the (possibly infinite) interval \((a, b)\) that cross zero are split into two integrals, one from \((a, 0)\) and one from \((0, b)\). Each integral is separately integrated to the given relative_tolerance.

Precision loss near limits of integration in definite integrals
When integrating certain definite integrals, there can be significant precision loss in evaluating the integrand near the endpoints. This has to do with the breakdown in precision of double precision floating point values when adding or subtracting a small number from a number much larger than it in magnitude (for instance, \(1.0 - x\)). \(xc\) (as passed to the integrand) is a high-precision version of the distance between \(x\) and the definite integral endpoints and can be used to address this issue. More information (and an example where this is useful) is given in the User’s Guide. For zero crossing integrals, \(xc\) will be a high precision version of the distance to the endpoints of the two smaller integrals. For any integral with an endpoint at negative infinity or positive infinity, \(xc\) is set to NaN.

Algorithmic details
Internally the 1D integrator uses the double-exponential methods in the Boost 1D quadrature library. Boost in turn makes use of quadrature methods developed in (Takahasi and Mori 1974), (Mori 1978), (Bailey, Jeyabalan, and Li 2005), and (Tanaka et al. 2009).

The gradients of the integral are computed in accordance with the Leibniz integral rule. Gradients of the integrand are computed internally with Stan’s automatic differentiation.

11.5. Reduce-sum function
Stan provides a higher-order reduce function for summation. A function which returns a scalar \(g: U \to \text{real}\) is mapped to every element of a list of type array[] \(U, \{x_1, x_2, \ldots\}\) and all the results are accumulated,
\[
g(x_1) + g(x_2) + \ldots
\]
For efficiency reasons the reduce function doesn’t work with the element-wise evaluated function \(g\) itself, but instead works through evaluating partial sums, \(f: \text{array[]} U \to \text{real}\), where:
\[
f(\{x_1\}) = g(x_1)
\]
Mathematically the summation reduction is associative and forming arbitrary partial sums in an arbitrary order will not change the result. However, floating point numerics on computers only have a limited precision such that associativity does not hold exactly. This implies that the order of summation determines the exact numerical result. For this reason, the higher-order reduce function is available in two variants:

- **reduce_sum**: Automatically choose partial sums partitioning based on a dynamic scheduling algorithm.
- **reduce_sum_static**: Compute the same sum as reduce_sum, but partition the input in the same way for given data set (in reduce_sum this partitioning might change depending on computer load). This should result in stable numerical evaluations.

**Specifying the reduce-sum function**

The higher-order reduce function takes a partial sum function \( f \), an array argument \( x \) (with one array element for each term in the sum), a recommended grainsize, and a set of shared arguments. This representation allows parallelization of the resultant sum.

```plaintext
real reduce_sum(F f, array[] T x, int grainsize, T1 s1, T2 s2, ...)
real reduce_sum_static(F f, array[] T x, int grainsize, T1 s1, T2 s2, ...)
```

Returns the equivalent of \( f(x, 1, \text{size}(x), s1, s2, ...) \), but computes the result in parallel by breaking the array \( x \) into independent partial sums. \( s1, s2, ... \) are shared between all terms in the sum.

*Available since 2.23*

- \( f \): function literal referring to a function specifying the partial sum operation. Refer to the partial sum function.
- \( x \): array of \( T \), one for each term of the reduction, \( T \) can be any type.
- **grainsize**: For reduce_sum, grainsize is the recommended size of the partial sum (grainsize = 1 means pick totally automatically). For reduce_sum_static, grainsize determines the maximum size of the partial sums, type int,
- \( s1 \): first (optional) shared argument, type \( T1 \), where \( T1 \) can be any type
- \( s2 \): second (optional) shared argument, type \( T2 \), where \( T2 \) can be any type,
11.6. Map-rect function

Stan provides a higher-order map function. This allows map-reduce functionality to be coded in Stan as described in the user’s guide.

Specifying the mapped function

The function being mapped must have a signature identical to that of the function \( f \) in the following declaration.

```plaintext
vector f(vector phi, vector theta, 
       data array[] real x_r, data array[] int x_i);
```

The map function returns the sequence of results for the particular shard being evaluated. The arguments to the mapped function are:

- \( phi \), the sequence of parameters shared across shards
- \( theta \), the sequence of parameters specific to this shard
• \( x_r \), sequence of real-valued data
• \( x_i \), sequence of integer data

All input for the mapped function must be packed into these sequences and all output from the mapped function must be packed into a single vector. The vector of output from each mapped function is concatenated into the final result.

**Rectangular map**
The rectangular map function operates on rectangular (not ragged) data structures, with parallel data structures for job-specific parameters, job-specific real data, and job-specific integer data.

```cpp
vector map_rect(F f, vector phi, array[] vector theta, data array[,] real x_r, data array[,] int x_i)
```

Return the concatenation of the results of applying the function \( f \), of type \((vector, vector, array[,] real, array[,] int):vector\) elementwise, i.e., \( f(phi, theta[n], x_r[n], x_i[n]) \) for each \( n \) in \( 1:N \), where \( N \) is the size of the parallel arrays of job-specific/local parameters \( theta \), real data \( x_r \), and integer data \( x_r \). The shared/global parameters \( phi \) are passed to each invocation of \( f \).

*Available since 2.18*
12. Deprecated Functions

This appendix lists currently deprecated functionality along with how to replace it.
Starting in Stan 2.29, deprecated functions with drop in replacements (such as the renaming of `get_lp` or `multiply_log`) will be removed 3 versions later e.g., functions deprecated in Stan 2.20 will be removed in Stan 2.23 and placed in Removed Functions. The Stan compiler can automatically update these on the behalf of the user for the entire deprecation window and at least one version following the removal.

12.1. Integer division with operator/ 

*Deprecated*: Using `/` with two integer arguments is interpreted as integer floor division, such that

\[
1/2 = 0
\]

This is deprecated due to its confusion with real-valued division, where

\[
1.0/2.0 = 0.5
\]

*Replacement*: Use the integer division operator `operator%/%` instead.

12.2. `integrate_ode_rk45`, `integrate_ode_adams`, `integrate_ode_bdf`

ODE Integrators

These ODE integrator functions have been replaced by those described in:

**Specifying an ordinary differential equation as a function**

A system of ODEs is specified as an ordinary function in Stan within the functions block. The ODE system function must have this function signature:

```plaintext
array[] real ode(real time, array[] real state, array[] real theta,
                 array[] real x_r, array[] int x_i);
```

The ODE system function should return the derivative of the state with respect to time at the time provided. The length of the returned real array must match the length of the state input into the function.
The arguments to this function are:

- \textit{time}, the time to evaluate the ODE system
- \textit{state}, the state of the ODE system at the time specified
- \textit{theta}, parameter values used to evaluate the ODE system
- \textit{x}_r, data values used to evaluate the ODE system
- \textit{x}_i, integer data values used to evaluate the ODE system.

The ODE system function separates parameter values, \textit{theta}, from data values, \textit{x}_r, for efficiency in computing the gradients of the ODE.

**Non-stiff solver**

\begin{verbatim}
array[,,] real  \texttt{integrate\_ode\_rk45}(function ode, array[,,] real initial_state, real initial_time, array[,,] real times, array[,,] real theta, array[,,] real x_r, array[,,] int x_i)
\end{verbatim}

Solves the ODE system for the times provided using the Dormand-Prince algorithm, a 4th/5th order Runge-Kutta method.

*Available since 2.10, deprecated in 2.24*

\begin{verbatim}
array[,,] real  \texttt{integrate\_ode\_rk45}(function ode, array[,,] real initial_state, real initial_time, array[,,] real times, array[,,] real theta, array[,,] real x_r, array[,,] int x_i, real rel_tol, real abs_tol, int max_num_steps)
\end{verbatim}

Solves the ODE system for the times provided using the Dormand-Prince algorithm, a 4th/5th order Runge-Kutta method with additional control parameters for the solver.

*Available since 2.10, deprecated in 2.24*

\begin{verbatim}
array[,,] real  \texttt{integrate\_ode}(function ode, array[,,] real initial_state, real initial_time, array[,,] real times, array[,,] real theta, array[,,] real x_r, array[,,] int x_i)
\end{verbatim}

Solves the ODE system for the times provided using the Dormand-Prince algorithm, a 4th/5th order Runge-Kutta method.

*Available since 2.10, deprecated in 2.24*

\begin{verbatim}
array[,,] real  \texttt{integrate\_ode\_adams}(function ode, array[,,] real initial_state, real initial_time, array[,,] real times, array[,,] real theta, data array[,,] real x_r, data array[,,] int x_i)
\end{verbatim}

Solves the ODE system for the times provided using the Adams-Moulton method.

*Available since 2.23, deprecated in 2.24*
12.2. INTEGRATE_ODE_RK45, INTEGRATE_ODE_ADAMS, INTEGRATE_ODE_BDF

ODE INTEGRATORS

array[,] real integrate_ode_adams(function ode, array[] real initial_state, real initial_time, array[] real times, array[] real theta, data array[] real x_r, data array[] int x_i, data real rel_tol, data real abs_tol, data int max_num_steps)
Solves the ODE system for the times provided using the Adams-Moulton method with additional control parameters for the solver.
Available since 2.23, deprecated in 2.24

Stiff solver
array[,] real integrate_ode_bdf(function ode, array[] real initial_state, real initial_time, array[] real times, array[] real theta, data array[] real x_r, data array[] int x_i)
Solves the ODE system for the times provided using the backward differentiation formula (BDF) method.
Available since 2.10, deprecated in 2.24

Arguments to the ODE solvers
The arguments to the ODE solvers in both the stiff and non-stiff cases are as follows.

• **ode**: function literal referring to a function specifying the system of differential equations with signature:

\[(\text{real, array[]} \text{real, array[]} \text{real, data array[]} \text{real, data array[]} \text{int}):\text{array}[] \text{real}\]

The arguments represent (1) time, (2) system state, (3) parameters, (4) real data, and (5) integer data, and the return value contains the derivatives with respect to time of the state,

• **initial_state**: initial state, type array[] real,
• **initial_time**: initial time, type int or real,
• **times**: solution times, type array[] real,
• **theta**: parameters, type array[] real,
• data x_r: real data, type array[] real, data only, and
• data x_i: integer data, type array[] int, data only.

For more fine-grained control of the ODE solvers, these parameters can also be provided:
• data rel_tol: relative tolerance for the ODE solver, type real, data only,
• data abs_tol: absolute tolerance for the ODE solver, type real, data only, and
• data max_num_steps: maximum number of steps to take in the ODE solver, type int, data only.

Return values
The return value for the ODE solvers is an array of type array[,] real, with values consisting of solutions at the specified times.

Sizes and parallel arrays
The sizes must match, and in particular, the following groups are of the same size:
• state variables passed into the system function, derivatives returned by the system function, initial state passed into the solver, and rows of the return value of the solver,
• solution times and number of rows of the return value of the solver,
• parameters, real data and integer data passed to the solver will be passed to the system function

12.3. algebra_solver, algebra_solver_newton algebraic solvers
These algebraic solver functions have been replaced by those described in:

Specifying an algebraic equation as a function
An algebraic system is specified as an ordinary function in Stan within the function block. The algebraic system function must have this signature:

```
vector algebra_system(vector y, vector theta,
                      data array[] real x_r, array[] int x_i)
```

The algebraic system function should return the value of the algebraic function which goes to 0, when we plug in the solution to the algebraic system.

The argument of this function are:
• $y$, the unknowns we wish to solve for
• $\theta$, parameter values used to evaluate the algebraic system
• $x_r$, data values used to evaluate the algebraic system
• $x_i$, integer data used to evaluate the algebraic system

The algebraic system function separates parameter values, $\theta$, from data values, $x_r$, for efficiency in propagating the derivatives through the algebraic system.

**Call to the algebraic solver**

```plaintext
vector algebra_solver(function algebra_system, vector y_guess, vector theta, data array[] real x_r, array[] int x_i)
```

Solves the algebraic system, given an initial guess, using the Powell hybrid algorithm.

*Available since 2.17, deprecated in 2.31*

```plaintext
vector algebra_solver(function algebra_system, vector y_guess, vector theta, data array[] real x_r, array[] int x_i, data real rel_tol, data real f_tol, int max_steps)
```

Solves the algebraic system, given an initial guess, using the Powell hybrid algorithm with additional control parameters for the solver.

*Available since 2.17, deprecated in 2.31*

**Note:** In future releases, the function `algebra_solver` will be deprecated and replaced with `algebra_solver_powell`.

```plaintext
vector algebra_solver_newton(function algebra_system, vector y_guess, vector theta, data array[] real x_r, array[] int x_i)
```

Solves the algebraic system, given an initial guess, using Newton’s method.

*Available since 2.24, deprecated in 2.31*

```plaintext
vector algebra_solver_newton(function algebra_system, vector y_guess, vector theta, data array[] real x_r, array[] int x_i, data real rel_tol, data real f_tol, int max_steps)
```

Solves the algebraic system, given an initial guess, using Newton’s method with additional control parameters for the solver.

*Available since 2.24, deprecated in 2.31*

**Arguments to the algebraic solver**
The arguments to the algebraic solvers are as follows:

• `algebra_system`: function literal referring to a function specifying the system of algebraic equations with signature (vector, vector, array[] real,
array[] int):vector. The arguments represent (1) unknowns, (2) parameters, (3) real data, and (4) integer data, and the return value contains the value of the algebraic function, which goes to 0 when we plug in the solution to the algebraic system,

- \texttt{y\_guess}: initial guess for the solution, type vector,
- \texttt{theta}: parameters only, type vector,
- \texttt{x\_r}: real data only, type \texttt{array[]} \texttt{real}, and
- \texttt{x\_i}: integer data only, type \texttt{array[]} \texttt{int}.

For more fine-grained control of the algebraic solver, these parameters can also be provided:

- \texttt{rel\_tol}: relative tolerance for the algebraic solver, type real, data only,
- \texttt{function\_tol}: function tolerance for the algebraic solver, type real, data only,
- \texttt{max\_num\_steps}: maximum number of steps to take in the algebraic solver, type int, data only.

\textit{Return value}

The return value for the algebraic solver is an object of type vector, with values which, when plugged in as \texttt{y} make the algebraic function go to 0.

\textit{Sizes and parallel arrays}

Certain sizes have to be consistent. The initial guess, return value of the solver, and return value of the algebraic function must all be the same size.

The parameters, real data, and integer data will be passed from the solver directly to the system function.
13. Removed Functions

Functions which once existed in the Stan language and have since been replaced or removed are listed here.

13.1. `multiply_log` and `binomial_coefficient_log` functions

*Removed*: Currently two non-conforming functions ending in suffix `_log`.

*Replacement*: Replace `multiply_log(...)` with `lmultiply(...). Replace `binomial_coefficient_log(...)` with `lchoose(...).

*Removed In*: Stan 2.33

13.2. `get_lp()` function

*Removed*: The built-in no-argument function `get_lp()` is deprecated.

*Replacement*: Use the no-argument function `target()` instead.

*Removed In*: Stan 2.33

13.3. `fabs` function

*Removed*: The unary function `fabs` is deprecated.

*Replacement*: Use the unary function `abs` instead. Note that the return type for `abs` is different for integer overloads, but this replacement is safe due to Stan’s type promotion rules.

*Removed In*: Stan 2.33

13.4. Exponentiated quadratic covariance functions

These covariance functions have been replaced by those described in:

With magnitude $\alpha$ and length scale $l$, the exponentiated quadratic kernel is:

$$k(x_i, x_j) = \alpha^2 \exp \left( -\frac{1}{2\rho^2} \sum_{d=1}^{D} (x_{i,d} - x_{j,d})^2 \right)$$
matrix `cov_exp_quad`\(\text{(row\_vectors} \ x, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x\).
*Available since 2.16, deprecated since 2.20, removed in 2.33*

matrix `cov_exp_quad`\(\text{(vectors} \ x, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x\).
*Available since 2.16, deprecated since 2.20, removed in 2.33*

matrix `cov_exp_quad`\(\text{\[array\[\] real} \ x, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x\).
*Available since 2.16, deprecated since 2.20, removed in 2.33*

matrix `cov_exp_quad`\(\text{\[row\_vectors} \ x_1, \ \text{row\_vectors} \ x_2, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x_1\) and \(x_2\).
*Available since 2.18, deprecated since 2.20, removed in 2.33*

matrix `cov_exp_quad`\(\text{\[vectors} \ x_1, \ \text{vectors} \ x_2, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x_1\) and \(x_2\).
*Available since 2.18, deprecated since 2.20, removed in 2.33*

matrix `cov_exp_quad`\(\text{\[array\[\] real} \ x_1, \ \text{array\[\] real} \ x_2, \ \text{real} \ \alpha, \ \text{real} \ \rho)\)
The covariance matrix with an exponentiated quadratic kernel of \(x_1\) and \(x_2\).
*Available since 2.18, deprecated since 2.20, removed in 2.33*

### 13.5. Real arguments to logical operators `operator&&`, `operator||`, and `operator!`

*Removed:* A nonzero real number (even NaN) was interpreted as true and a zero was interpreted as false.

*Replacement:* Explicit \(x \neq 0\) comparison is preferred instead.

*Removed In:* Stan 2.34
14. Conventions for Probability Functions

Functions associated with distributions are set up to follow the same naming conventions for both built-in distributions and for user-defined distributions.

14.1. Suffix marks type of function

The suffix is determined by the type of function according to the following table.

<table>
<thead>
<tr>
<th>function</th>
<th>outcome</th>
<th>suffix</th>
</tr>
</thead>
<tbody>
<tr>
<td>log probability mass function</td>
<td>discrete</td>
<td>_lpmf</td>
</tr>
<tr>
<td>log probability density function</td>
<td>continuous</td>
<td>_lpdf</td>
</tr>
<tr>
<td>log cumulative distribution function</td>
<td>any</td>
<td>_lcdf</td>
</tr>
<tr>
<td>log complementary cumulative distribution function</td>
<td>any</td>
<td>_lccdf</td>
</tr>
<tr>
<td>random number generator</td>
<td>any</td>
<td>_rng</td>
</tr>
</tbody>
</table>

For example, normal_lpdf is the log of the normal probability density function (pdf) and bernoulli_lpmf is the log of the bernoulli probability mass function (pmf). The log of the corresponding cumulative distribution functions (cdf) use the same suffix, normal_lcdf and bernoulli_lcdf.

14.2. Argument order and the vertical bar

Each probability function has a specific outcome value and a number of parameters. Following conditional probability notation, probability density and mass functions use a vertical bar to separate the outcome from the parameters of the distribution. For example, normal_lpdf(y | mu, sigma) returns the value of mathematical formula log Normal(y | μ, σ). Cumulative distribution functions separate the outcome from the parameters in the same way (e.g., normal_lcdf(y_low | mu, sigma).

14.3. Sampling notation

The notation

\[ y \sim \text{normal}(\mu, \sigma); \]

provides the same (proportional) contribution to the model log density as the explicit target density increment,
In both cases, the effect is to add terms to the target log density. The only difference is that the example with the sampling (\sim) notation drops all additive constants in the log density; the constants are not necessary for any of Stan’s sampling, approximation, or optimization algorithms.

14.4. Finite inputs

All of the distribution functions are configured to throw exceptions (effectively rejecting samples or optimization steps) when they are supplied with non-finite arguments. The two cases of non-finite arguments are the infinite values and not-a-number value—these are standard in floating-point arithmetic.

14.5. Boundary conditions

Many distributions are defined with support or constraints on parameters forming an open interval. For example, the normal density function accepts a scale parameter \( \sigma > 0 \). If \( \sigma = 0 \), the probability function will throw an exception.

This is true even for (complementary) cumulative distribution functions, which will throw exceptions when given input that is out of the support.

14.6. Pseudorandom number generators

For most of the probability functions, there is a matching pseudorandom number generator (PRNG) with the suffix \_rng. For example, the function \texttt{normal\_rng(\text{real}, \text{real})} accepts two real arguments, an unconstrained location \( \mu \) and positive scale \( \sigma > 0 \), and returns an unconstrained pseudorandom value drawn from Normal\((\mu, \sigma)\). There are also vectorized forms of random number generators which return more than one random variate at a time.

**Restricted to transformed data and generated quantities**

Unlike regular functions, the PRNG functions may only be used in the transformed data or generated quantities blocks.

**Limited vectorization**

Unlike the probability functions, only some of the PRNG functions are vectorized.

14.7. Cumulative distribution functions

For most of the univariate probability functions, there is a corresponding cumulative distribution function, log cumulative distribution function, and log complementary
cumulative distribution function.

For a univariate random variable $Y$ with probability function $p_Y(y \mid \theta)$, the cumulative distribution function (CDF) $F_Y$ is defined by

$$F_Y(y) = \Pr[Y \leq y] = \int_{-\infty}^{y} p(y \mid \theta) \, dy.$$ 

The complementary cumulative distribution function (CCDF) is defined as

$$\Pr[Y > y] = 1 - F_Y(y).$$

The reason to use CCDFs instead of CDFs in floating-point arithmetic is that it is possible to represent numbers very close to 0 (the closest you can get is roughly $10^{-300}$), but not numbers very close to 1 (the closest you can get is roughly $1 - 10^{-15}$).

In Stan, there is a cumulative distribution function for each probability function. For instance, `normal_cdf(y | mu, sigma)` is defined by

$$\int_{-\infty}^{y} \text{Normal}(y \mid \mu, \sigma) \, dy.$$ 

There are also log forms of the CDF and CCDF for most univariate distributions. For example, `normal_lcdf(y | mu, sigma)` is defined by

$$\log \left( \int_{-\infty}^{y} \text{Normal}(y \mid \mu, \sigma) \, dy \right)$$

and `normal_lccdf(y | mu, sigma)` is defined by

$$\log \left( 1 - \int_{-\infty}^{y} \text{Normal}(y \mid \mu, \sigma) \, dy \right).$$

### 14.8. Vectorization

Stan’s univariate log probability functions, including the log density functions, log mass functions, log CDFs, and log CCDFs, all support vectorized function application, with results defined to be the sum of the elementwise application of the function. Some of the PRNG functions support vectorization, see section vectorized PRNG functions for more details.

In all cases, matrix operations are at least as fast and usually faster than loops and vectorized log probability functions are faster than their equivalent form defined
with loops. This isn’t because loops are slow in Stan, but because more efficient automatic differentiation can be used. The efficiency comes from the fact that a vectorized log probability function only introduces one new node into the expression graph, thus reducing the number of virtual function calls required to compute gradients in C++, as well as from allowing caching of repeated computations.

Stan also overloads the multivariate normal distribution, including the Cholesky-factor form, allowing arrays of row vectors or vectors for the variate and location parameter. This is a huge savings in speed because the work required to solve the linear system for the covariance matrix is only done once.

Stan also overloads some scalar functions, such as log and exp, to apply to vectors (arrays) and return vectors (arrays). These vectorizations are defined elementwise and unlike the probability functions, provide only minimal efficiency speedups over repeated application and assignment in a loop.

**Vectorized function signatures**

**Vectorized scalar arguments**

The normal probability function is specified with the signature

```plaintext
normal_lpdf(reals | reals, reals);
```

The pseudotype `reals` is used to indicate that an argument position may be vectorized. Argument positions declared as `reals` may be filled with a real, a one-dimensional array, a vector, or a row-vector. If there is more than one array or vector argument, their types can be anything but their size must match. For instance, it is legal to use `normal_lpdf(row_vector | vector, real)` as long as the vector and row vector have the same size.

**Vectorized vector and row vector arguments**

The multivariate normal distribution accepting vector or array of vector arguments is written as

```plaintext
multi_normal_lpdf(vectors | vectors, matrix);
```

These arguments may be row vectors, column vectors, or arrays of row vectors or column vectors.

**Vectorized integer arguments**

The pseudotype `ints` is used for vectorized integer arguments. Where it appears either an integer or array of integers may be used.
Evaluating vectorized log probability functions
The result of a vectorized log probability function is equivalent to the sum of the evaluations on each element. Any non-vector argument, namely real or int, is repeated. For instance, if \( y \) is a vector of size \( N \), \( \mu \) is a vector of size \( N \), and \( \sigma \) is a scalar, then

\[
ll = \text{normal}\_\text{lpdf}(y \mid \mu, \sigma);
\]
is just a more efficient way to write

```plaintext
ll = 0;
for (n in 1:N) {
    ll = ll + \text{normal}\_\text{lpdf}(y[n] \mid \mu[n], \sigma);
}
```

With the same arguments, the vectorized sampling statement

```plaintext
y \sim \text{normal}(\mu, \sigma);
```
has the same effect on the total log probability as

```plaintext
for (n in 1:N) {
    y[n] \sim \text{normal}(\mu[n], \sigma);
}
```

Evaluating vectorized PRNG functions
Some PRNG functions accept sequences as well as scalars as arguments. Such functions are indicated by argument pseudotypes reals or ints. In cases of sequence arguments, the output will also be a sequence. For example, the following is allowed in the transformed data and generated quantities blocks.

```plaintext
vector[3] mu = // ...
array[3] real x = \text{normal}\_\text{rng}(mu, 3);
```

Argument types
In the case of PRNG functions, arguments marked ints may be integers or integer arrays, whereas arguments marked reals may be integers or reals, integer or real arrays, vectors, or row vectors.

<table>
<thead>
<tr>
<th>pseudotype</th>
<th>allowable PRNG arguments</th>
</tr>
</thead>
<tbody>
<tr>
<td>ints</td>
<td>int, array[,] int</td>
</tr>
<tr>
<td>reals</td>
<td>int, array[,] int, real, array[,] real, vector, row_vector</td>
</tr>
</tbody>
</table>
**Dimension matching**

In general, if there are multiple non-scalar arguments, they must all have the same dimensions, but need not have the same type. For example, the `normal_rng` function may be called with one vector argument and one real array argument as long as they have the same number of elements.

```plaintext
vector[3] mu = // ...
array[3] real sigma = // ...
array[3] real x = normal_rng(mu, sigma);
```

**Return type**

The result of a vectorized PRNG function depends on the size of the arguments and the distribution’s support. If all arguments are scalars, then the return type is a scalar. For a continuous distribution, if there are any non-scalar arguments, the return type is a real array (`array[] real`) matching the size of any of the non-scalar arguments, as all non-scalar arguments must have matching size. Discrete distributions return ints and continuous distributions return reals, each of appropriate size. The symbol $R$ denotes such a return type.
Discrete Distributions
15. Binary Distributions

Binary probability distributions have support on \{0, 1\}, where 1 represents the value true and 0 the value false.

15.1. Bernoulli distribution

Probability mass function
If \( \theta \in [0, 1] \), then for \( y \in \{0, 1\} \),

\[
\text{Bernoulli}(y \mid \theta) = \begin{cases} 
\theta & \text{if } y = 1, \\
1 - \theta & \text{if } y = 0.
\end{cases}
\]

Sampling statement
\( y \sim \text{bernoulli}(\theta) \)

Increment target log probability density with \( \text{bernoulli_lupmf}(y \mid \theta) \).

Available since 2.0

Stan Functions

\text{real \hspace{1em} bernoulli_lpmf}(\text{ints } y \mid \text{reals } \theta)

The log Bernoulli probability mass of \( y \) given chance of success \( \theta \)

Available since 2.12

\text{real \hspace{1em} bernoulli_lupmf}(\text{ints } y \mid \text{reals } \theta)

The log Bernoulli probability mass of \( y \) given chance of success \( \theta \) dropping constant additive terms

Available since 2.25

\text{real \hspace{1em} bernoulli_cdf}(\text{ints } y \mid \text{reals } \theta)

The Bernoulli cumulative distribution function of \( y \) given chance of success \( \theta \)

Available since 2.0

\text{real \hspace{1em} bernoulli_lcdf}(\text{ints } y \mid \text{reals } \theta)

The log of the Bernoulli cumulative distribution function of \( y \) given chance of success \( \theta \)

Available since 2.12

\text{real \hspace{1em} bernoulli_lccdf}(\text{ints } y \mid \text{reals } \theta)

The log of the Bernoulli complementary cumulative distribution function of \( y \) given
15.2. BERNOUlli DISTRIBUTION, LOGIT PARAMETERIZATION

Stan also supplies a direct parameterization in terms of a logit-transformed chance-of-success parameter. This parameterization is more numerically stable if the chance-of-success parameter is on the logit scale, as with the linear predictor in a logistic regression.

**Probability mass function**
If $\alpha \in \mathbb{R}$, then for $y \in \{0, 1\}$,

$$\text{BernoulliLogit}(y \mid \alpha) = \begin{cases} \text{logit}^{-1}(\alpha) & \text{if } y = 1, \\ 1 - \text{logit}^{-1}(\alpha) & \text{if } y = 0. \end{cases}$$

**Sampling statement**

$$y \sim \text{bernoulli_logit}(\alpha)$$

Increment target log probability density with $\text{bernoulli_logit_lupmf}(y \mid \alpha)$.

**Stan Functions**

- `real bernoulli_logit_lpmf(ints y | reals alpha)`
  The log Bernoulli probability mass of $y$ given chance of success $\text{inv_logit}(\alpha)$
  
  *Available since 2.12*

- `real bernoulli_logit_lupmf(ints y | reals alpha)`
  The log Bernoulli probability mass of $y$ given chance of success $\text{inv_logit}(\alpha)$ dropping constant additive terms
  
  *Available since 2.25*

- `R bernoulli_logit_rng(reals alpha)`
  Generate a Bernoulli variate with chance of success $\text{logit}^{-1}(\alpha)$; may only be used in transformed data and generated quantities blocks. For a description of argument
162 CHAPTER 15. BINARY DISTRIBUTIONS

and return types, see section vectorized PRNG functions.
Available since 2.18

15.3. Bernoulli-logit generalized linear model (Logistic Regression)

Stan also supplies a single function for a generalized linear model with Bernoulli
likelihood and logit link function, i.e. a function for a logistic regression. This
provides a more efficient implementation of logistic regression than a manually
written regression in terms of a Bernoulli likelihood and matrix multiplication.

Probability mass function
If \( x \in \mathbb{R}^{n \times m}, \alpha \in \mathbb{R}^n, \beta \in \mathbb{R}^m \), then for \( y \in \{0, 1\}^n \),

\[
\text{BernoulliLogitGLM}(y \mid x, \alpha, \beta) = \prod_{1 \leq i \leq n} \text{Bernoulli}(y_i \mid \logit^{-1}(\alpha_i + x_i \cdot \beta))
\]

\[
= \prod_{1 \leq i \leq n} \left\{ \begin{array}{ll}
\logit^{-1}(\alpha_i + \sum_{1 \leq j \leq m} x_{ij} \cdot \beta_j) & \text{if } y_i = 1, \\
1 - \logit^{-1}(\alpha_i + \sum_{1 \leq j \leq m} x_{ij} \cdot \beta_j) & \text{if } y_i = 0.
\end{array} \right.
\]

Sampling statement
\( y \sim \text{bernoulli_logit_glm}(x, \alpha, \beta) \)

Increment target log probability density with \( \text{bernoulli_logit_glm_lupmf}(y \mid x, \alpha, \beta) \).
Available since 2.25

Stan Functions
real \( \text{bernoulli_logit_glm_lpmf}(\text{int } y \mid \text{matrix } x, \text{real } \alpha, \text{vector } \beta) \)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv_logit}(\alpha + x \cdot \beta) \).
Available since 2.23

real \( \text{bernoulli_logit_glm_lupmf}(\text{int } y \mid \text{matrix } x, \text{real } \alpha, \text{vector } \beta) \)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv_logit}(\alpha + x \cdot \beta) \) dropping constant additive terms.
Available since 2.25

real \( \text{bernoulli_logit_glm_lpmf}(\text{int } y \mid \text{matrix } x, \text{vector } \alpha, \text{vector } \beta) \)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv_logit}(\alpha + x \cdot \beta) \).
Available since 2.23
BERNOULLI-LOGIT GENERALIZED LINEAR MODEL (LOGISTIC REGRESSION)

\[
+ x * \beta)
\]

Available since 2.23

real \texttt{bernoulli\_logit\_glm\_lupmf}(int y \mid matrix x, vector alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \) dropping constant additive terms.
Available since 2.25

real \texttt{bernoulli\_logit\_glm\_lpmf}(array[] int y \mid row_vector x, real alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \).
Available since 2.23

real \texttt{bernoulli\_logit\_glm\_lupmf}(array[] int y \mid row_vector x, real alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \) dropping constant additive terms.
Available since 2.25

real \texttt{bernoulli\_logit\_glm\_lpmf}(array[] int y \mid row_vector x, vector alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \).
Available since 2.23

real \texttt{bernoulli\_logit\_glm\_lupmf}(array[] int y \mid row_vector x, vector alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \) dropping constant additive terms.
Available since 2.25

real \texttt{bernoulli\_logit\_glm\_lpmf}(array[] int y \mid matrix x, real alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \).
Available since 2.18

real \texttt{bernoulli\_logit\_glm\_lupmf}(array[] int y \mid matrix x, real alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(alpha + x * beta) \) dropping constant additive terms.
Available since 2.25
CHAPTER 15. BINARY DISTRIBUTIONS

\[ + x \times \beta \) dropping constant additive terms.

Available since 2.25

real \texttt{bernoulli\_logit\_glm\_lpmf}(array[] int y | matrix x, vector alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(\text{alpha} + x \times \beta) \).

Available since 2.18

real \texttt{bernoulli\_logit\_glm\_lupmf}(array[] int y | matrix x, vector alpha, vector beta)
The log Bernoulli probability mass of \( y \) given chance of success \( \text{inv\_logit}(\text{alpha} + x \times \beta) \) dropping constant additive terms.

Available since 2.25

array[] int \texttt{bernoulli\_logit\_glm\_rng}(matrix x, vector alpha, vector beta)
Generate an array of Bernoulli variates with chances of success \( \text{inv\_logit}(\text{alpha} + x \times \beta) \); may only be used in transformed data and generated quantities blocks.

Available since 2.29

array[] int \texttt{bernoulli\_logit\_glm\_rng}(row\_vector x, vector alpha, vector beta)
Generate an array of Bernoulli variates with chances of success \( \text{inv\_logit}(\text{alpha} + x \times \beta) \); may only be used in transformed data and generated quantities blocks.

Available since 2.29
16. Bounded Discrete Distributions

Bounded discrete probability functions have support on \( \{0, \ldots, N\} \) for some upper bound \( N \).

16.1. Binomial distribution

**Probability mass function**
Suppose \( N \in \mathbb{N} \) and \( \theta \in [0, 1] \), and \( n \in \{0, \ldots, N\} \).

\[
\text{Binomial}(n | N, \theta) = \binom{N}{n} \theta^n (1 - \theta)^{N-n}.
\]

**Log probability mass function**

\[
\log \text{Binomial}(n | N, \theta) = \log \Gamma(N + 1) - \log \Gamma(n + 1) - \log \Gamma(N - n + 1)
+ n \log \theta + (N - n) \log(1 - \theta),
\]

**Gradient of log probability mass function**

\[
\frac{\partial}{\partial \theta} \log \text{Binomial}(n | N, \theta) = \frac{n}{\theta} - \frac{N - n}{1 - \theta}
\]

**Sampling statement**

\( n \sim \text{binomial}(N, \theta) \)

Increment target log probability density with \( \text{binomial_lupmf}(n \mid N, \theta) \).

*Available since 2.0*

**Stan functions**

- **real** \( \text{binomial_lpmf}(\text{ints} n \mid \text{ints} N, \text{reals} \theta) \)
  The log binomial probability mass of \( n \) successes in \( N \) trials given chance of success \( \theta \)

  *Available since 2.12*

- **real** \( \text{binomial_lupmf}(\text{ints} n \mid \text{ints} N, \text{reals} \theta) \)
  The log binomial probability mass of \( n \) successes in \( N \) trials given chance of success

165
theta dropping constant additive terms

Available since 2.25

real binomial_cdf(ints n | ints N, reals theta)
The binomial cumulative distribution function of n successes in N trials given chance of success theta

Available since 2.0

real binomial_lcdf(ints n | ints N, reals theta)
The log of the binomial cumulative distribution function of n successes in N trials given chance of success theta

Available since 2.12

real binomial_lccdf(ints n | ints N, reals theta)
The log of the binomial complementary cumulative distribution function of n successes in N trials given chance of success theta

Available since 2.12

R binomial_rng(ints N, reals theta)
Generate a binomial variate with N trials and chance of success theta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

Available since 2.18

16.2. Binomial distribution, logit parameterization

Stan also provides a version of the binomial probability mass function distribution with the chance of success parameterized on the unconstrained logistic scale.

Probability mass function
Suppose \( N \in \mathbb{N}, \alpha \in \mathbb{R}, \) and \( n \in \{0, \ldots, N\} \). Then

\[
\text{BinomialLogit}(n \mid N, \alpha) = \text{Binomial}(n \mid N, \logit^{-1}(\alpha)) = \binom{N}{n} \left(\logit^{-1}(\alpha)\right)^{n} \left(1 - \logit^{-1}(\alpha)\right)^{N-n}.
\]

Log probability mass function

\[
\log \text{BinomialLogit}(n \mid N, \alpha) = \log \Gamma(N + 1) - \log \Gamma(n + 1) - \log \Gamma(N - n + 1) \\
+ n \log \logit^{-1}(\alpha) + (N - n) \log \left(1 - \logit^{-1}(\alpha)\right),
\]

16.3. **BINOMIAL-LOGIT GENERALIZED LINEAR MODEL (LOGISTIC REGRESSION)**

**Gradient of log probability mass function**

\[
\frac{\partial}{\partial \alpha} \log \text{BinomialLogit}(n \mid N, \alpha) = \frac{n}{\logit^{-1}(-\alpha)} - \frac{N - n}{\logit^{-1}(\alpha)}
\]

**Sampling statement**

\[n \sim \text{binomial_logit}(N, \alpha)\]

Increment target log probability density with binomial_logit_lupmf(n \mid N, alpha).

*Available since 2.0*

**Stan functions**

`real binomial_logit_lpmf(ints n \mid ints N, reals alpha)`

The log binomial probability mass of n successes in N trials given logit-scaled chance of success alpha

*Available since 2.12*

`real binomial_logit_lupmf(ints n \mid ints N, reals alpha)`

The log binomial probability mass of n successes in N trials given logit-scaled chance of success alpha dropping constant additive terms

*Available since 2.25*

---

16.3. **Binomial-logit generalized linear model (Logistic Regression)**

Stan also supplies a single function for a generalized linear model with binomial likelihood and logit link function, i.e., a function for logistic regression with aggregated outcomes. This provides a more efficient implementation of logistic regression than a manually written regression in terms of a Binomial likelihood and matrix multiplication.

**Probability mass function**

Suppose \(N \in \mathbb{N}, x \in \mathbb{R}^{n \cdot m}, \alpha \in \mathbb{R}^n, \beta \in \mathbb{R}^m\), and \(n \in \{0, \ldots, N\}\). Then

\[
\text{BinomialLogitGLM}(n \mid N, x, \alpha, \beta) = \text{Binomial}(n \mid N, \logit^{-1}(\alpha_i + x_i \cdot \beta))
\]

\[=inom{N}{n} \left(\logit^{-1}(\alpha_i + \sum_{1 \leq j \leq m} x_{ij} \cdot \beta_j)\right)^n \left(1 - \logit^{-1}(\alpha_i + \sum_{1 \leq j \leq m} x_{ij} \cdot \beta_j)\right)^{N-n}.
\]

**Sampling statement**

\[n \sim \text{binomial_logit_glm}(N, x, \alpha, \beta)\]
Increment target log probability density with binomial_logit_glm_lupmf(n | N, x, alpha, beta).

*Available since 2.34*

**Stan Functions**

```stan
real binomial_logit_glm_lpmf(int n | int N, matrix x, real alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta).
```

*Available since 2.34*

```stan
real binomial_logit_glm_lupmf(int n | int N, matrix x, real alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta) dropping constant additive terms.
```

*Available since 2.34*

```stan
real binomial_logit_glm_lpmf(int n | int N, matrix x, vector alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta).
```

*Available since 2.34*

```stan
real binomial_logit_glm_lupmf(int n | int N, matrix x, vector alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta) dropping constant additive terms.
```

*Available since 2.34*

```stan
real binomial_logit_glm_lpmf(array[] int n | array[] int N, row_vector x, real alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta).
```

*Available since 2.34*

```stan
real binomial_logit_glm_lupmf(array[] int n | array[] int N, row_vector x, real alpha, vector beta)
```

The log binomial probability mass of n given N trials and chance of success

```
inv_logit(alpha + x * beta) dropping constant additive terms.
```

*Available since 2.34*
The log binomial probability mass of \( n \) given \( N \) trials and chance of success \( \text{inv_logit}(\alpha + x \times \beta) \).

**Available since 2.34**

```c
real binomial_logit_glm_lpmf(array[] int n | array[] int N, row_vector x, vector alpha, vector beta)
```

The log binomial probability mass of \( n \) given \( N \) trials and chance of success \( \text{inv_logit}(\alpha + x \times \beta) \) dropping constant additive terms.

**Available since 2.34**

```c
real binomial_logit_glm_lupmf(array[] int n | array[] int N, matrix x, real alpha, vector beta)
```

The log binomial probability mass of \( n \) given \( N \) trials and chance of success \( \text{inv_logit}(\alpha + x \times \beta) \).

**Available since 2.34**

```c
real binomial_logit_glm_lupmf(array[] int n | array[] int N, matrix x, vector alpha, vector beta)
```

The log binomial probability mass of \( n \) given \( N \) trials and chance of success \( \text{inv_logit}(\alpha + x \times \beta) \) dropping constant additive terms.

**Available since 2.34**

```c
real binomial_logit_glm_lpmf(array[] int n | array[] int N, matrix x, vector alpha, vector beta)
```

The log binomial probability mass of \( n \) given \( N \) trials and chance of success \( \text{inv_logit}(\alpha + x \times \beta) \).

**Available since 2.34**

16.4. **Beta-binomial distribution**

**Probability mass function**

If \( N \in \mathbb{N} \), \( \alpha \in \mathbb{R}^+ \), and \( \beta \in \mathbb{R}^+ \), then for \( n \in 0, \ldots, N \),

\[
\text{BetaBinomial}(n \mid N, \alpha, \beta) = \binom{N}{n} \frac{B(n + \alpha, N - n + \beta)}{B(\alpha, \beta)},
\]

where \( B(x, y) \) is the beta function.
where the beta function \( B(u, v) \) is defined for \( u \in \mathbb{R}^+ \) and \( v \in \mathbb{R}^+ \) by
\[
B(u, v) = \frac{\Gamma(u) \Gamma(v)}{\Gamma(u + v)}.
\]

**Sampling statement**

\[
\text{n } \sim \text{ beta_binomial}(N, \alpha, \beta)
\]

Increment target log probability density with `beta_binomial_lupmf(n | N, alpha, beta)`.

*Available since 2.0*

**Stan functions**

- **`real beta_binomial_lpmf(ints n | ints N, reals alpha, reals beta)`**
  The log beta-binomial probability mass of \( n \) successes in \( N \) trials given prior success count (plus one) of \( \alpha \) and prior failure count (plus one) of \( \beta \)

  *Available since 2.12*

- **`real beta_binomial_lupmf(ints n | ints N, reals alpha, reals beta)`**
  The log beta-binomial probability mass of \( n \) successes in \( N \) trials given prior success count (plus one) of \( \alpha \) and prior failure count (plus one) of \( \beta \) dropping constant additive terms

  *Available since 2.25*

- **`real beta_binomial_cdf(ints n | ints N, reals alpha, reals beta)`**
  The beta-binomial cumulative distribution function of \( n \) successes in \( N \) trials given prior success count (plus one) of \( \alpha \) and prior failure count (plus one) of \( \beta \)

  *Available since 2.0*

- **`real beta_binomial_lcdf(ints n | ints N, reals alpha, reals beta)`**
  The log of the beta-binomial cumulative distribution function of \( n \) successes in \( N \) trials given prior success count (plus one) of \( \alpha \) and prior failure count (plus one) of \( \beta \)

  *Available since 2.12*

- **`real beta_binomial_lccdf(ints n | ints N, reals alpha, reals beta)`**
  The log of the beta-binomial complementary cumulative distribution function of \( n \) successes in \( N \) trials given prior success count (plus one) of \( \alpha \) and prior failure count (plus one) of \( \beta \)

  *Available since 2.12*

- **`R beta_binomial_rng(ints N, reals alpha, reals beta)`**
  Generate a beta-binomial variate with \( N \) trials, prior success count (plus one) of
16.5. HYPERGEOMETRIC DISTRIBUTION

alpha, and prior failure count (plus one) of beta; may only be used in transformed
data and generated quantities blocks. For a description of argument and return
types, see section vectorized PRNG functions.

Available since 2.18

16.5. Hypergeometric distribution

Probability mass function

If \( a \in \mathbb{N}, b \in \mathbb{N}, \) and \( N \in \{0, \ldots, a + b\}, \) then for \( n \in \{\max(0, N - b), \ldots, \min(a, N)\}, \)

\[
\text{Hypergeometric}(n \mid N, a, b) = \frac{\binom{a}{n} \binom{b}{N-n}}{\binom{a+b}{N}}.
\]

Sampling statement

\( n \sim \text{hypergeometric}(N, a, b) \)

Increment target log probability density with \( \text{hypergeometric_lupmf}(n \mid N, a, b) \).

Available since 2.0

Stan functions

\( \text{real } \text{hypergeometric_lpmf}(\text{int } n \mid \text{int } N, \text{int } a, \text{int } b) \)
The log hypergeometric probability mass of \( n \) successes in \( N \) trials given total
success count of \( a \) and total failure count of \( b \)

Available since 2.12

\( \text{real } \text{hypergeometric_lupmf}(\text{int } n \mid \text{int } N, \text{int } a, \text{int } b) \)
The log hypergeometric probability mass of \( n \) successes in \( N \) trials given total
success count of \( a \) and total failure count of \( b \) dropping constant additive terms

Available since 2.25

\( \text{int } \text{hypergeometric_rng}(\text{int } N, \text{int } a, \text{int } b) \)
Generate a hypergeometric variate with \( N \) trials, total success count of \( a \), and total
failure count of \( b \); may only be used in transformed data and generated quantities
blocks

Available since 2.18
16.6. Categorical distribution

Probability mass functions

If $N \in \mathbb{N}$, $N > 0$, and if $\theta \in \mathbb{R}^N$ forms an $N$-simplex (i.e., has nonnegative entries summing to one), then for $y \in \{1, \ldots, N\}$,

$$\text{Categorical}(y \mid \theta) = \theta_y.$$ 

In addition, Stan provides a log-odds scaled categorical distribution,

$$\text{CategoricalLogit}(y \mid \beta) = \text{Categorical}(y \mid \text{softmax}(\beta)).$$

See the definition of softmax for the definition of the softmax function.

Sampling statement

$$y \sim \text{categorical}(\text{theta})$$

Increment target log probability density with $\text{categorical\_lupmf}(y \mid \text{theta})$ dropping constant additive terms.

Available since 2.0

Sampling statement

$$y \sim \text{categorical\_logit}(\text{beta})$$

Increment target log probability density with $\text{categorical\_logit\_lupmf}(y \mid \text{beta})$.

Available since 2.4

Stan functions

All of the categorical distributions are vectorized so that the outcome $y$ can be a single integer (type int) or an array of integers (type array[] int).

real $\text{categorical\_lpmf}(\text{ints} y \mid \text{vector} \ \text{theta})$

The log categorical probability mass function with outcome(s) $y$ in $1 : N$ given $N$-vector of outcome probabilities $\theta$. The parameter $\theta$ must have non-negative entries that sum to one, but it need not be a variable declared as a simplex.

Available since 2.12

real $\text{categorical\_lupmf}(\text{ints} y \mid \text{vector} \ \text{theta})$

The log categorical probability mass function with outcome(s) $y$ in $1 : N$ given $N$-vector of outcome probabilities $\theta$ dropping constant additive terms. The parameter $\theta$ must have non-negative entries that sum to one, but it need not be a variable declared as a simplex.

Available since 2.25
16.7. CATEGORICAL LOGIT GENERALIZED LINEAR MODEL (SOFTMAX REGRESSION)

Stan also supplies a single function for a generalized linear model with categorical likelihood and logit link function, i.e. a function for a softmax regression. This provides a more efficient implementation of softmax regression than a manually written regression in terms of a Categorical likelihood and matrix multiplication.

Note that the implementation does not put any restrictions on the coefficient matrix $\beta$. It is up to the user to use a reference category, a suitable prior or some other means of identifiability. See Multi-logit in the Stan User’s Guide.

### Probability mass functions

If $N, M, K \in \mathbb{N}$, $N, M, K > 0$, and if $x \in \mathbb{R}^{M \times K}, \alpha \in \mathbb{R}^{N}, \beta \in \mathbb{R}^{K \cdot N}$, then for $y \in \{1, \ldots, N\}^{M}$,

$$
\text{CategoricalLogitGLM}(y \mid x, \alpha, \beta) = \prod_{1 \leq i \leq M} \text{CategoricalLogit}(y_i \mid \alpha + x_i \cdot \beta)
$$

$$
= \prod_{1 \leq i \leq M} \text{Categorical}(y_i \mid \text{softmax}(\alpha + x_i \cdot \beta)).
$$

See the definition of softmax for the definition of the softmax function.
Sampling statement

\[ y \sim \text{categorical}\_\text{logit}_\text{glm}(x, \alpha, \beta) \]

Increment target log probability density with \[ \text{categorical}\_\text{logit}_\text{glm}_\text{lupmf}(y \mid x, \alpha, \beta) \].

\textit{Available since 2.23}

Stan functions

\begin{align*}
\text{real} & \quad \text{categorical}\_\text{logit}_\text{glm}\_\text{lpmf}(\text{int } y \mid \text{row}\_\text{vector } x, \text{vector } \alpha, \text{matrix } \beta) \\
& \text{The log categorical probability mass function with outcome } y \text{ in } 1:N \text{ given } N\text{-vector of log-odds of outcomes } \alpha + x \star \beta. \\
& \textit{Available since 2.23}
\end{align*}

\begin{align*}
\text{real} & \quad \text{categorical}\_\text{logit}_\text{glm}\_\text{lupmf}(\text{int } y \mid \text{row}\_\text{vector } x, \text{vector } \alpha, \text{matrix } \beta) \\

\end{align*}

\begin{align*}
\text{real} & \quad \text{categorical}\_\text{logit}_\text{glm}\_\text{lupmf}(\text{array}[\text{int } y \mid \text{row}\_\text{vector } x, \text{vector } \alpha, \text{matrix } \beta) \\
& \text{The log categorical probability mass function with outcomes } y \text{ in } 1:N \text{ given } N\text{-vector of log-odds of outcomes } \alpha + x \star \beta. \\
& \textit{Available since 2.23}
\end{align*}
The log categorical probability mass function with outcomes $y$ in $1 : N$ given $N$-vector of log-odds of outcomes $\alpha + x \times \beta$ dropping constant additive terms.

Available since 2.25

```stan
real categorical_logit_glm_lpmf(array[] int y | matrix x, vector alpha, matrix beta)
```

The log categorical probability mass function with outcomes $y$ in $1 : N$ given $N$-vector of log-odds of outcomes $\alpha + x \times \beta$.

Available since 2.23

```stan
real categorical_logit_glm_lupmf(array[] int y | matrix x, vector alpha, matrix beta)
```

The log categorical probability mass function with outcomes $y$ in $1 : N$ given $N$-vector of log-odds of outcomes $\alpha + x \times \beta$ dropping constant additive terms.

Available since 2.25

### 16.8. Discrete range distribution

#### Probability mass functions

If $l, u \in \mathbb{Z}$ are lower and upper bounds ($l \leq u$), then for any integer $y \in \{l, \ldots, u\}$,

$$\text{DiscreteRange}(y | l, u) = \frac{1}{u - l + 1}.$$ 

#### Sampling statement

```
y ~ discrete_range(l, u)
```

Increment the target log probability density with `discrete_range_lupmf(y | l, u)` dropping constant additive terms.

Available since 2.26

#### Stan functions

All of the discrete range distributions are vectorized so that the outcome $y$ and the bounds $l, u$ can be a single integer (type `int`) or an array of integers (type `array[] int`).

```stan
real discrete_range_lpmf(ints y | ints l, ints u)
```

The log probability mass function with outcome(s) $y$ in $l : u$.

Available since 2.26

```stan
real discrete_range_lupmf(ints y | ints l, ints u)
```
The log probability mass function with outcome(s) $y$ in $l : u$ dropping constant additive terms. 

Available since 2.26

```cpp
real discrete_range_cdf(ints y | ints l, ints u)
```

The discrete range cumulative distribution function for the given $y$, lower and upper bounds.

Available since 2.26

```cpp
real discrete_range_lcdf(ints y | ints l, ints u)
```

The log of the discrete range cumulative distribution function for the given $y$, lower and upper bounds.

Available since 2.26

```cpp
real discrete_range_lccdf(ints y | ints l, ints u)
```

The log of the discrete range complementary cumulative distribution function for the given $y$, lower and upper bounds.

Available since 2.26

```cpp
int discrete_range_rng(ints l, ints u)
```

Generate a discrete variate between the given lower and upper bounds; may only be used in transformed data and generated quantities blocks.

Available since 2.26

### 16.9. Ordered logistic distribution

**Probability mass function**

If $K \in \mathbb{N}$ with $K > 2$, $c \in \mathbb{R}^{K-1}$ such that $c_k < c_{k+1}$ for $k \in \{1, \ldots, K-2\}$, and $\eta \in \mathbb{R}$, then for $k \in \{1, \ldots, K\}$,

$$
\text{OrderedLogistic}(k | \eta, c) = \begin{cases} 
1 - \logit^{-1}(\eta - c_1) & \text{if } k = 1, \\
\logit^{-1}(\eta - c_{k-1}) - \logit^{-1}(\eta - c_k) & \text{if } 1 < k < K, \text{and} \\
\logit^{-1}(\eta - c_{K-1}) - 0 & \text{if } k = K.
\end{cases}
$$

The $k = K$ case is written with the redundant subtraction of zero to illustrate the parallelism of the cases; the $k = 1$ and $k = K$ edge cases can be subsumed into the general definition by setting $c_0 = -\infty$ and $c_K = +\infty$ with $\logit^{-1}(-\infty) = 0$ and $\logit^{-1}(\infty) = 1$.

**Sampling statement**

```cpp
k ~ ordered_logistic(eta, c)
```
16.10. ORDERED LOGISTIC GENERALIZED LINEAR MODEL (ORDINAL REGRESSION)

Increment target log probability density with `ordered_logistic_lupmf(k | eta, c)`.

**Available since 2.0**

**Stan functions**

```stan
real ordered_logistic_lpmf(ints k | vector eta, vectors c)
The log ordered logistic probability mass of k given linear predictors eta, and cutpoints c.
Available since 2.18

real ordered_logistic_lupmf(ints k | vector eta, vectors c)
The log ordered logistic probability mass of k given linear predictors eta, and cutpoints c dropping constant additive terms.
Available since 2.25

int ordered_logistic_rng(real eta, vector c)
Generate an ordered logistic variate with linear predictor eta and cutpoints c; may only be used in transformed data and generated quantities blocks
Available since 2.0
```

16.10. Ordered logistic generalized linear model (ordinal regression)

**Probability mass function**

If \( N, M, K \in \mathbb{N} \) with \( N, M > 0, K > 2, c \in \mathbb{R}^{K-1} \) such that \( c_k < c_{k+1} \) for \( k \in \{1, \ldots, K-2\} \), and \( x \in \mathbb{R}^{N \times M}, \beta \in \mathbb{R}^M \), then for \( y \in \{1, \ldots, K\}^N \),

\[
\text{OrderedLogisticGLM}(y \mid x, \beta, c) = \prod_{1 \leq i \leq N} \text{OrderedLogistic}(y_i \mid x_i \cdot \beta, c)
\]

\[
= \prod_{1 \leq i \leq N} \begin{cases} 
1 - \logit^{-1}(x_i \cdot \beta - c_1) & \text{if } y = 1, \\
\logit^{-1}(x_i \cdot \beta - c_{y-1}) - \logit^{-1}(x_i \cdot \beta - c_y) & \text{if } 1 < y < K, \text{ and} \\
\logit^{-1}(x_i \cdot \beta - c_{K-1}) - 0 & \text{if } y = K.
\end{cases}
\]

The \( k = K \) case is written with the redundant subtraction of zero to illustrate the parallelism of the cases; the \( y = 1 \) and \( y = K \) edge cases can be subsumed into the general definition by setting \( c_0 = -\infty \) and \( c_K = +\infty \) with \( \logit^{-1}(-\infty) = 0 \) and \( \logit^{-1}(\infty) = 1 \).
Sampling statement
\[ y \sim \text{ordered_logistic glm}(x, \beta, c) \]
Increment target log probability density with \( \text{ordered_logistic_lupmf}(y \mid x, \beta, c) \).
*Available since 2.23*

**Stan functions**
real  \( \text{ordered_logistic glm lpmf}(\text{int } y \mid \text{row_vector } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \). The cutpoints \( c \) must be ordered.
*Available since 2.23*

real  \( \text{ordered_logistic glm lupmf}(\text{int } y \mid \text{row_vector } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \) dropping constant additive terms. The cutpoints \( c \) must be ordered.
*Available since 2.25*

real  \( \text{ordered_logistic glm lpmf}(\text{int } y \mid \text{matrix } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \). The cutpoints \( c \) must be ordered.
*Available since 2.23*

real  \( \text{ordered_logistic glm lupmf}(\text{int } y \mid \text{matrix } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \) dropping constant additive terms. The cutpoints \( c \) must be ordered.
*Available since 2.25*

real  \( \text{ordered_logistic glm lpmf}(\text{array[] int } y \mid \text{row_vector } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \). The cutpoints \( c \) must be ordered.
*Available since 2.23*

real  \( \text{ordered_logistic glm lupmf}(\text{array[] int } y \mid \text{row_vector } x, \text{vector } \beta, \text{vector } c) \)
The log ordered logistic probability mass of \( y \), given linear predictors \( x \star \beta \), and cutpoints \( c \) dropping constant additive terms. The cutpoints \( c \) must be ordered.
16.11. ORDERED PROBIT DISTRIBUTION

Available since 2.25

real  ordered_logistic_glm_lpmf(array[] int y | matrix x, vector beta, vector c)
The log ordered logistic probability mass of y, given linear predictors x * beta, and cutpoints c. The cutpoints c must be ordered.  
Available since 2.23

real  ordered_logistic_glm_lupmf(array[] int y | matrix x, vector beta, vector c)
The log ordered logistic probability mass of y, given linear predictors x * beta, and cutpoints c dropping constant additive terms. The cutpoints c must be ordered.  
Available since 2.25

16.11. Ordered probit distribution

Probability mass function

If $K \in \mathbb{N}$ with $K > 2$, $c \in \mathbb{R}^{K-1}$ such that $c_k < c_{k+1}$ for $k \in \{1, \ldots, K-2\}$, and $\eta \in \mathbb{R}$, then for $k \in \{1, \ldots, K\}$,

$$\text{OrderedProbit}(k \mid \eta, c) = \begin{cases} 
1 - \Phi(\eta - c_1) & \text{if } k = 1, \\
\Phi(\eta - c_{k-1}) - \Phi(\eta - c_k) & \text{if } 1 < k < K, \text{and} \\
\Phi(\eta - c_{K-1}) - 0 & \text{if } k = K.
\end{cases}$$

The $k = K$ case is written with the redundant subtraction of zero to illustrate the parallelism of the cases; the $k = 1$ and $k = K$ edge cases can be subsumed into the general definition by setting $c_0 = -\infty$ and $c_K = +\infty$ with $\Phi(-\infty) = 0$ and $\Phi(\infty) = 1$.

Sampling statement

$k \sim \text{ordered_probit}(\eta, c)$

Increment target log probability density with ordered_probit_lupmf(k | eta, c).

Available since 2.19

Stan functions

real  ordered_probit_lpmf(ints k | vector eta, vectors c)
The log ordered probit probability mass of k given linear predictors eta, and cutpoints c.

Available since 2.18

real  ordered_probit_lupmf(ints k | vector eta, vectors c)
The log ordered probit probability mass of $k$ given linear predictors $\eta$, and cut-points $c$ dropping constant additive terms.

*Available since 2.25*

```c
real ordered_probit_lpmf(ints k | real eta, vectors c)
```

The log ordered probit probability mass of $k$ given linear predictor $\eta$, and cutpoints $c$.

*Available since 2.19*

```c
real ordered_probit_lupmf(ints k | real eta, vectors c)
```

The log ordered probit probability mass of $k$ given linear predictor $\eta$, and cutpoints $c$ dropping constant additive terms.

*Available since 2.19*

```c
int ordered_probit_rng(real eta, vector c)
```

Generate an ordered probit variate with linear predictor $\eta$ and cutpoints $c$; may only be used in transformed data and generated quantities blocks.

*Available since 2.18*
17. Unbounded Discrete Distributions

The unbounded discrete distributions have support over the natural numbers (i.e., the non-negative integers).

17.1. Negative binomial distribution

For the negative binomial distribution Stan uses the parameterization described in Gelman et al. (2013). For alternative parameterizations, see section negative binomial glm.

**Probability mass function**

If $\alpha \in \mathbb{R}^+$ and $\beta \in \mathbb{R}^+$, then for $n \in \mathbb{N}$,

$$\text{NegBinomial}(n \mid \alpha, \beta) = \binom{n + \alpha - 1}{\alpha - 1} \left(\frac{\beta}{\beta + 1}\right)^\alpha \left(\frac{1}{\beta + 1}\right)^n.$$ 

The mean and variance of a random variable $n \sim \text{NegBinomial}(\alpha, \beta)$ are given by

$$\mathbb{E}[n] = \frac{\alpha}{\beta} \quad \text{and} \quad \text{Var}[n] = \frac{\alpha}{\beta^2} (\beta + 1).$$

**Sampling statement**

$n \sim \text{neg_binomial}(alpha, beta)$

Increment target log probability density with $\text{neg_binomial_lupmf}(n \mid alpha, beta)$.

Available since 2.0

**Stan functions**

`real neg_binomial_lpmf(ints n | reals alpha, reals beta)`

The log negative binomial probability mass of $n$ given shape alpha and inverse scale beta

Available since 2.12

`real neg_binomial_lupmf(ints n | reals alpha, reals beta)`

The log negative binomial probability mass of $n$ given shape alpha and inverse scale beta dropping constant additive terms

Available since 2.25
17.2. Negative binomial distribution (alternative parameterization)

Stan also provides an alternative parameterization of the negative binomial distribution directly using a mean (i.e., location) parameter and a parameter that controls overdispersion relative to the square of the mean. Section combinatorial functions, below, provides a second alternative parameterization directly in terms of the log mean.

Probability mass function
The first parameterization is for $\mu \in \mathbb{R}^+$ and $\phi \in \mathbb{R}^+$, which for $n \in \mathbb{N}$ is defined as

$$\text{NegBinomial2}(n \mid \mu, \phi) = \binom{n + \phi - 1}{n} \left( \frac{\mu}{\mu + \phi} \right)^n \left( \frac{\phi}{\mu + \phi} \right)^{\phi}.$$

The mean and variance of a random variable $n \sim \text{NegBinomial2}(n \mid \mu, \phi)$ are

$$\mathbb{E}[n] = \mu \quad \text{and} \quad \text{Var}[n] = \mu + \frac{\mu^2}{\phi}.$$
Recall that Poisson(\(\mu\)) has variance \(\mu\), so \(\mu^2/\phi > 0\) is the additional variance of the negative binomial above that of the Poisson with mean \(\mu\). So the inverse of parameter \(\phi\) controls the overdispersion, scaled by the square of the mean, \(\mu^2\).

**Sampling statement**

\[n \sim \text{neg_binomial}_2(\mu, \phi)\]

Increment target log probability density with \(\text{neg_binomial}_2\_lupmf(n \mid \mu, \phi)\).

*Available since 2.3*

**Stan functions**

- **real neg_binomial_2_lpmf(ints n \mid reals mu, reals phi)**
  - The log negative binomial probability mass of \(n\) given location \(\mu\) and precision \(\phi\).
  - *Available since 2.20*

- **real neg_binomial_2_lupmf(ints n \mid reals mu, reals phi)**
  - The log negative binomial probability mass of \(n\) given location \(\mu\) and precision \(\phi\) dropping constant additive terms.
  - *Available since 2.25*

- **real neg_binomial_2_cdf(ints n \mid reals mu, reals phi)**
  - The negative binomial cumulative distribution function of \(n\) given location \(\mu\) and precision \(\phi\).
  - *Available since 2.6*

- **real neg_binomial_2_lcdf(ints n \mid reals mu, reals phi)**
  - The log of the negative binomial cumulative distribution function of \(n\) given location \(\mu\) and precision \(\phi\).
  - *Available since 2.12*

- **real neg_binomial_2_lccdf(ints n \mid reals mu, reals phi)**
  - The log of the negative binomial complementary cumulative distribution function of \(n\) given location \(\mu\) and precision \(\phi\).
  - *Available since 2.12*

- **R neg_binomial_2_rng(reals mu, reals phi)**
  - Generate a negative binomial variate with location \(\mu\) and precision \(\phi\); may only be used in transformed data and generated quantities blocks. \(\mu\) must be less than \(2^{29}\). For a description of argument and return types, see section vectorized function signatures.
  - *Available since 2.18*
17.3. Negative binomial distribution (log alternative parameterization)

Related to the parameterization in section negative binomial, alternative parameterization, the following parameterization uses a log mean parameter $\eta = \log(\mu)$, defined for $\eta \in \mathbb{R}, \phi \in \mathbb{R}^+$, so that for $n \in \mathbb{N}$,

$\text{NegBinomial2Log}(n \mid \eta, \phi) = \text{NegBinomial2}(n \mid \exp(\eta), \phi)$.

This alternative may be used for sampling, as a function, and for random number generation, but as of yet, there are no CDFs implemented for it. This is especially useful for log-linear negative binomial regressions.

**Sampling statement**

$n \sim \text{neg_binomial_2_log}(\eta, \phi)$

Increment target log probability density with $\text{neg_binomial_2_log_lupmf}(n \mid \eta, \phi)$.

*Available since 2.3*

**Stan functions**

*real neg_binomial_2_log_lpmf(ints n | reals eta, reals phi)*

The log negative binomial probability mass of $n$ given log-location $\eta$ and inverse overdispersion parameter $\phi$.

*Available since 2.20*

*real neg_binomial_2_log_lupmf(ints n | reals eta, reals phi)*

The log negative binomial probability mass of $n$ given log-location $\eta$ and inverse overdispersion parameter $\phi$ dropping constant additive terms.

*Available since 2.25*

*R neg_binomial_2_log_rng(reals eta, reals phi)*

Generate a negative binomial variate with log-location $\eta$ and inverse overdispersion control $\phi$; may only be used in transformed data and generated quantities blocks. $\eta$ must be less than 29 log 2. For a description of argument and return types, see section vectorized function signatures.

*Available since 2.18*

17.4. Negative-binomial-2-log generalized linear model (negative binomial regression)

Stan also supplies a single function for a generalized linear model with negative binomial likelihood and log link function, i.e. a function for a negative binomial
regression. This provides a more efficient implementation of negative binomial regression than a manually written regression in terms of a negative binomial likelihood and matrix multiplication.

**Probability mass function**

If \( x \in \mathbb{R}^{n \times m}, \alpha \in \mathbb{R}^n, \beta \in \mathbb{R}^m, \phi \in \mathbb{R}^+ \), then for \( y \in \mathbb{N}^n \),

\[
\text{NegBinomial2LogGLM}(y \mid x, \alpha, \beta, \phi) = \prod_{1 \leq i \leq n} \text{NegBinomial2}(y_i \mid \exp(\alpha_i + x_i \cdot \beta), \phi).
\]

**Sampling statement**

\( y \sim \text{neg\_binomial\_2\_log\_glm}(x, \alpha, \beta, \phi) \)

Increment target log probability density with \( \text{neg\_binomial\_2\_log\_glm\_lupmf}(y \mid x, \alpha, \beta, \phi) \).

*Available since 2.19*

**Stan functions**

- `real neg_binomial_2_log_glm_lpmf(int y | matrix x, real alpha, vector beta, real phi)`
  
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \cdot \beta \) and inverse overdispersion parameter \( \phi \).
  
  *Available since 2.23*

- `real neg_binomial_2_log_glm_lupmf(int y | matrix x, real alpha, vector beta, real phi)`
  
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \cdot \beta \) and inverse overdispersion parameter \( \phi \) dropping constant additive terms.
  
  *Available since 2.25*

- `real neg_binomial_2_log_glm_lpmf(int y | matrix x, vector alpha, vector beta, real phi)`
  
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \cdot \beta \) and inverse overdispersion parameter \( \phi \).
  
  *Available since 2.23*

- `real neg_binomial_2_log_glm_lupmf(int y | matrix x, vector alpha, vector beta, real phi)`
  
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \cdot \beta \) and inverse overdispersion parameter \( \phi \) dropping constant additive terms.
  
  *Available since 2.25*

- `real neg_binomial_2_log_glm_lpmf(array[] int y | row_vector x, real alpha, vector beta, real phi)`
alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \).

\[ \text{Available since 2.23} \]

real \( \text{neg_binomial_2_log_glm_lupmf} \)(array[] int \( y \) | row_vector \( x \),
real alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \) dropping constant additive terms.

\[ \text{Available since 2.25} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | row_vector \( x \),
vector alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \).

\[ \text{Available since 2.23} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | row_vector \( x \),
vector alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \) dropping constant additive terms.

\[ \text{Available since 2.25} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | matrix \( x \), real alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \).

\[ \text{Available since 2.18} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | matrix \( x \), real alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \) dropping constant additive terms.

\[ \text{Available since 2.25} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | matrix \( x \), vector alpha, vector beta, real phi)
The log negative binomial probability mass of \( y \) given log-location \( \alpha + x \times beta \) and inverse overdispersion parameter \( \phi \).

\[ \text{Available since 2.18} \]

real \( \text{neg_binomial_2_log_glm_lpmf} \)(array[] int \( y \) | matrix \( x \), vector alpha, vector beta, real phi)
The log negative binomial probability mass of $y$ given log-location $\alpha + x \times \beta$ and inverse overdispersion parameter $\phi$ dropping constant additive terms.  

Available since 2.25

17.5. Poisson distribution

Probability mass function
If $\lambda \in \mathbb{R}^+$, then for $n \in \mathbb{N}$,

$$
\text{Poisson}(n|\lambda) = \frac{1}{n!} \lambda^n \exp(-\lambda).
$$

Sampling statement

$n \sim \text{poisson}(\lambda)$

Increment target log probability density with $\text{poisson_lupmf}(n \mid \lambda)$.

Available since 2.0

Stan functions

real $\text{poisson_lpmf}(\text{ints } n \mid \text{reals } \lambda)$
The log Poisson probability mass of $n$ given rate $\lambda$

Available since 2.12

real $\text{poisson_lupmf}(\text{ints } n \mid \text{reals } \lambda)$
The log Poisson probability mass of $n$ given rate $\lambda$ dropping constant additive terms

Available since 2.25

real $\text{poisson_cdf}(\text{ints } n \mid \text{reals } \lambda)$
The Poisson cumulative distribution function of $n$ given rate $\lambda$

Available since 2.0

real $\text{poisson_lcdf}(\text{ints } n \mid \text{reals } \lambda)$
The log of the Poisson cumulative distribution function of $n$ given rate $\lambda$

Available since 2.12

real $\text{poisson_lccdf}(\text{ints } n \mid \text{reals } \lambda)$
The log of the Poisson complementary cumulative distribution function of $n$ given rate $\lambda$

Available since 2.12

R $\text{poisson_rng}(\text{reals } \lambda)$
Generate a Poisson variate with rate $\lambda$; may only be used in transformed data and generated quantities blocks. $\lambda$ must be less than $2^{30}$. For a description of
17.6. Poisson distribution, log parameterization

Stan also provides a parameterization of the Poisson using the log rate $\alpha = \log \lambda$ as a parameter. This is useful for log-linear Poisson regressions so that the predictor does not need to be exponentiated and passed into the standard Poisson probability function.

**Probability mass function**

If $\alpha \in \mathbb{R}$, then for $n \in \mathbb{N}$,

$$\text{PoissonLog}(n|\alpha) = \frac{1}{n!} \exp(n\alpha - \exp(\alpha)).$$

**Sampling statement**

$$n \sim \text{poisson_log}(\alpha)$$

Increment target log probability density with \text{poisson_log_lupmf}(n \mid \alpha).

**Stan functions**

- \text{real poisson_log_lpmf}(\text{ints n \mid reals alpha})
  The log Poisson probability mass of n given log rate alpha
  Available since 2.12

- \text{real poisson_log_lupmf}(\text{ints n \mid reals alpha})
  The log Poisson probability mass of n given log rate alpha dropping constant additive terms
  Available since 2.25

- \text{R poisson_log_rng}(\text{reals alpha})
  Generate a Poisson variate with log rate alpha; may only be used in transformed data and generated quantities blocks. alpha must be less than 30 log 2. For a description of argument and return types, see section vectorized function signatures.
  Available since 2.18

17.7. Poisson-log generalized linear model (Poisson regression)

Stan also supplies a single function for a generalized linear model with Poisson likelihood and log link function, i.e. a function for a Poisson regression. This provides a more efficient implementation of Poisson regression than a manually written regression in terms of a Poisson likelihood and matrix multiplication.
17.7. POISSON-LOG GENERALIZED LINEAR MODEL (POISSON REGRESSION)

**Probability mass function**

If \( x \in \mathbb{R}^{n \times m}, \alpha \in \mathbb{R}^n, \beta \in \mathbb{R}^m \), then for \( y \in \mathbb{N}^n \),

\[
\text{PoissonLogGLM}(y|x, \alpha, \beta) = \prod_{1 \leq i \leq n} \text{Poisson}(y_i | \exp(\alpha_i + x_i \cdot \beta)).
\]

**Sampling statement**

\( y \sim \text{poisson_log_glm}(x, \alpha, \beta) \)

Increment target log probability density with \( \text{poisson_log_glm_lupmf}(y | x, \alpha, \beta) \).

*Available since 2.19*

**Stan functions**

- **real** \( \text{poisson_log_glm_lpmf}(\text{int} \ y \ | \ \text{matrix} \ x, \ \text{real} \ \alpha, \ \text{vector} \ \beta) \)
  The log Poisson probability mass of \( y \) given the log-rate \( \alpha + x \cdot \beta \).
  *Available since 2.23*

- **real** \( \text{poisson_log_glm_lupmf}(\text{int} \ y \ | \ \text{matrix} \ x, \ \text{real} \ \alpha, \ \text{vector} \ \beta) \)
  The log Poisson probability mass of \( y \) given the log-rate \( \alpha + x \cdot \beta \) dropping constant additive terms.
  *Available since 2.25*

- **real** \( \text{poisson_log_glm_lpmf}(\text{int} \ y \ | \ \text{matrix} \ x, \ \text{vector} \ \alpha, \ \text{vector} \ \beta) \)
  The log Poisson probability mass of \( y \) given the log-rate \( \alpha + x \cdot \beta \).
  *Available since 2.23*

- **real** \( \text{poisson_log_glm_lupmf}(\text{int} \ y \ | \ \text{matrix} \ x, \ \text{vector} \ \alpha, \ \text{vector} \ \beta) \)
  The log Poisson probability mass of \( y \) given the log-rate \( \alpha + x \cdot \beta \) dropping constant additive terms.
  *Available since 2.25*

- **real** \( \text{poisson_log_glm_lpmf}(\text{array[]} \ \text{int} \ y \ | \ \text{row_vector} \ x, \ \text{real} \ \alpha, \ \text{vector} \ \beta) \)
  The log Poisson probability mass of \( y \) given the log-rate \( \alpha + x \cdot \beta \).
  *Available since 2.23*

- **real** \( \text{poisson_log_glm_lupmf}(\text{array[]} \ \text{int} \ y \ | \ \text{row_vector} \ x, \ \text{real} \ \alpha, \ \text{vector} \ \beta) \)
The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$ dropping constant additive terms.

*Available since 2.25*

```plaintext
real poisson_log_glm_lpmf(array[] int y | row_vector x, vector alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$.

*Available since 2.23*

```plaintext
real poisson_log_glm_lupmf(array[] int y | row_vector x, vector alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$ dropping constant additive terms.

*Available since 2.25*

```plaintext
real poisson_log_glm_lpmf(array[] int y | matrix x, real alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$.

*Available since 2.18*

```plaintext
real poisson_log_glm_lupmf(array[] int y | matrix x, real alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$ dropping constant additive terms.

*Available since 2.25*

```plaintext
real poisson_log_glm_lpmf(array[] int y | matrix x, vector alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$.

*Available since 2.18*

```plaintext
real poisson_log_glm_lupmf(array[] int y | matrix x, vector alpha, vector beta)
```

The log Poisson probability mass of $y$ given the log-rate $\alpha + x \times \beta$ dropping constant additive terms.

*Available since 2.25*
The multivariate discrete distributions are over multiple integer values, which are expressed in Stan as arrays.

### 18.1. Multinomial distribution

**Probability mass function**

If $K \in \mathbb{N}$, $N \in \mathbb{N}$, and $\theta \in K$-simplex, then for $y \in \mathbb{N}^K$ such that $\sum_{k=1}^{K} y_k = N$,

$$
\text{Multinomial}(y | \theta) = \binom{N}{y_1, \ldots, y_K} \prod_{k=1}^{K} \theta_k^{y_k},
$$

where the multinomial coefficient is defined by

$$
\binom{N}{y_1, \ldots, y_K} = \frac{N!}{\prod_{k=1}^{K} y_k!}.
$$

**Sampling statement**

$y \sim \text{multinomial}(\theta)$

Increment target log probability density with $\text{multinomial}_lupmf(y | \theta)$.

*Available since 2.0*

**Stan functions**

- `real multinomial_lpmf(array[] int y | vector theta)`
  The log multinomial probability mass function with outcome array $y$ of size $K$ given the $K$-simplex distribution parameter $\theta$ and (implicit) total count $N = \text{sum}(y)$.
  *Available since 2.12*

- `real multinomial_lupmf(array[] int y | vector theta)`
  The log multinomial probability mass function with outcome array $y$ of size $K$ given the $K$-simplex distribution parameter $\theta$ and (implicit) total count $N = \text{sum}(y)$ dropping constant additive terms.
  *Available since 2.25*

- `array[] int multinomial_rng(vector theta, int N)`
  Generate a multinomial variate with simplex distribution parameter $\theta$ and total count $N$; may only be used in transformed data and generated quantities blocks.
  *Available since 2.8*
18.2. Multinomial distribution, logit parameterization

Stan also provides a version of the multinomial probability mass function distribution with the $K$-simplex for the event count probabilities per category given on the unconstrained logistic scale.

**Probability mass function**

If $K \in \mathbb{N}$, $N \in \mathbb{N}$, and $\text{softmax}(\theta) \in K$-simplex, then for $y \in \mathbb{N}^K$ such that $\sum_{k=1}^K y_k = N$,

$$\text{MultinomialLogit}(y \mid \gamma) = \text{Multinomial}(y \mid \text{softmax}(\gamma)) = \binom{N}{y_1, \ldots, y_K} \prod_{k=1}^K [\text{softmax}(\gamma_k)]^{y_k},$$

where the multinomial coefficient is defined by

$$\binom{N}{y_1, \ldots, y_K} = \frac{N!}{\prod_{k=1}^K y_k!}.$$

**Sampling statement**

$y \sim \text{multinomial_logit}(\gamma)$

Increment target log probability density with \text{multinomial_logit_lupmf}(y \mid \gamma).

*Available since 2.24*

**Stan functions**

- \text{real \ multinomial_logit_lpmf}(array[] int y | vector gamma)
  The log multinomial probability mass function with outcome array $y$ of size $K$ given the log $K$-simplex distribution parameter $\gamma$ and (implicit) total count $N = \text{sum}(y)$
  *Available since 2.24*

- \text{real \ multinomial_logit_lupmf}(array[] int y | vector gamma)
  The log multinomial probability mass function with outcome array $y$ of size $K$ given the log $K$-simplex distribution parameter $\gamma$ and (implicit) total count $N = \text{sum}(y)$
  dropping constant additive terms
  *Available since 2.25*

- \text{array[] int \ multinomial_logit_rng}(vector gamma, int N)
  Generate a variate from a multinomial distribution with probabilities $\text{softmax}(\gamma)$ and total count $N$; may only be used in transformed data and generated quantities blocks.
  *Available since 2.24*
18.3. Dirichlet-multinomial distribution

Stan also provides the Dirichlet-multinomial distribution, which generalizes the Beta-binomial distribution to more than two categories. As such, it is an overdispersed version of the multinomial distribution.

**Probability mass function**

If $K \in \mathbb{N}$, $N \in \mathbb{N}$, and $\alpha \in \mathbb{R}_+^K$, then for $y \in \mathbb{N}^K$ such that $\sum_{k=1}^K y_k = N$, the PMF of the Dirichlet-multinomial distribution is defined as

$$
\text{DirMult}(y|\theta) = \frac{\Gamma(\alpha_0)\Gamma(N + 1)}{\Gamma(N + \alpha_0)} \prod_{k=1}^K \frac{\Gamma(y_k + \alpha_k)}{\Gamma(\alpha_k)\Gamma(y_k + 1)},
$$

where $\alpha_0$ is defined as $\alpha_0 = \sum_{k=1}^K \alpha_k$.

**Sampling statement**

$y \sim \text{dirichlet_multinomial}(\alpha)$

Increment target log probability density with $\text{dirichlet_multinomial_lupmf}(y | \alpha)$.

*Available since 2.34*

**Stan functions**

- **real** $\text{dirichlet_multinomial_lpmf}(\text{array[] int } y | \text{vector } \alpha)$
  The log multinomial probability mass function with outcome array $y$ with $K$ elements given the positive $K$-vector distribution parameter $\alpha$ and (implicit) total count $N = \text{sum}(y)$.
  *Available since 2.34*

- **real** $\text{dirichlet_multinomial_lupmf}(\text{array[] int } y | \text{vector } \alpha)$
  The log multinomial probability mass function with outcome array $y$ with $K$ elements, given the positive $K$-vector distribution parameter $\alpha$ and (implicit) total count $N = \text{sum}(y)$ dropping constant additive terms.
  *Available since 2.34*

- **array[] int** $\text{dirichlet_multinomial_rng}(\text{vector } \alpha, \text{int } N)$
  Generate a multinomial variate with positive vector distribution parameter $\alpha$ and total count $N$; may only be used in transformed data and generated quantities blocks. This is equivalent to $\text{multinomial_rng}(\text{dirichlet_rng}(\alpha), N)$.
  *Available since 2.34*
Continuous Distributions
19. Unbounded Continuous Distributions

The unbounded univariate continuous probability distributions have support on all real numbers.

19.1. Normal distribution

Probability density function
If $\mu \in \mathbb{R}$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}$,

$$
\text{Normal}(y|\mu, \sigma) = \frac{1}{\sqrt{2\pi} \sigma} \exp\left(-\frac{1}{2} \left(\frac{y - \mu}{\sigma}\right)^2\right).
$$

Sampling statement

$y \sim \text{normal}(\mu, \sigma)$

Increment target log probability density with $\text{normal_lupdf}(y | \mu, \sigma)$.

Available since 2.0

Stan functions

- real $\text{normal_lpdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma)$
The log of the normal density of $y$ given location $\mu$ and scale $\sigma$.

Available since 2.12

- real $\text{normal_lupdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma)$
The log of the normal density of $y$ given location $\mu$ and scale $\sigma$ dropping constant additive terms.

Available since 2.25

- real $\text{normal_cdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma)$
The cumulative normal distribution of $y$ given location $\mu$ and scale $\sigma$; $\text{normal_cdf}$ will underflow to 0 for $\frac{y-\mu}{\sigma}$ below -37.5 and overflow to 1 for $\frac{y-\mu}{\sigma}$ above 8.25; the function $\Phi_{\text{approx}}$ is more robust in the tails, but must be scaled and translated for anything other than a standard normal.

Available since 2.0

- real $\text{normal_lcdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma)$
The log of the cumulative normal distribution of $y$ given location $\mu$ and scale $\sigma$.
sigma; normal_lcdf will underflow to $-\infty$ for $\frac{y-\mu}{\sigma}$ below -37.5 and overflow to 0 for $\frac{y-\mu}{\sigma}$ above 8.25; $\log(\Phi_{\text{approx}}(...))$ is more robust in the tails, but must be scaled and translated for anything other than a standard normal.

*Available since 2.12*

**real normal_lccdf**(reals y | reals mu, reals sigma)

The log of the complementary cumulative normal distribution of y given location mu and scale sigma; normal_lccdf will overflow to 0 for $\frac{y-\mu}{\sigma}$ below -37.5 and underflow to $-\infty$ for $\frac{y-\mu}{\sigma}$ above 8.25; $\log1m(\Phi_{\text{approx}}(...))$ is more robust in the tails, but must be scaled and translated for anything other than a standard normal.

*Available since 2.15*

**R normal_rng**(reals mu, reals sigma)

Generate a normal variate with location mu and scale sigma; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

*Available since 2.18*

**Standard normal distribution**

The standard normal distribution is so-called because its parameters are the units for their respective operations—the location (mean) is zero and the scale (standard deviation) one. The standard normal is parameter-free, and the unit parameters allow considerable simplification of the expression for the density.

$$\text{StdNormal}(y) = \text{Normal}(y \mid 0, 1) = \frac{1}{\sqrt{2\pi}} \exp \left( -\frac{y^2}{2} \right).$$

Up to a proportion on the log scale, where Stan computes,

$$\log \text{Normal}(y \mid 0, 1) = \frac{-y^2}{2} + \text{const.}$$

With no logarithm, no subtraction, and no division by a parameter, the standard normal log density is much more efficient to compute than the normal log density with constant location 0 and scale 1.

**Sampling statement**

$$y \sim \text{std_normal}()$$

Increment target log probability density with std_normal_lupdf(y).

*Available since 2.19*
### 19.1. NORMAL DISTRIBUTION

#### Stan functions

- **real** `std_normal_lpdf(reals y)`
  The standard normal (location zero, scale one) log probability density of y.
  *Available since 2.18*

- **real** `std_normal_lupdf(reals y)`
  The standard normal (location zero, scale one) log probability density of y dropping constant additive terms.
  *Available since 2.25*

- **real** `std_normal_cdf(reals y)`
  The cumulative standard normal distribution of y; `std_normal_cdf` will underflow to 0 for y below -37.5 and overflow to 1 for y above 8.25; the function `Phi_approx` is more robust in the tails.
  *Available since 2.21*

- **real** `std_normal_lcdf(reals y)`
  The log of the cumulative standard normal distribution of y; `std_normal_lcdf` will underflow to $-\infty$ for y below -37.5 and overflow to 0 for y above 8.25; `log(Phi_approx(...))` is more robust in the tails.
  *Available since 2.21*

- **real** `std_normal_lccdf(reals y)`
  The log of the complementary cumulative standard normal distribution of y; `std_normal_lccdf` will overflow to 0 for y below -37.5 and underflow to $-\infty$ for y above 8.25; `log1m(Phi_approx(...))` is more robust in the tails.
  *Available since 2.21*

- **R** `std_normal_qf(T x)`
  Returns the value of the inverse standard normal cdf $\Phi^{-1}$ at the specified quantile x. The `std_normal_qf` is equivalent to the `inv_Phi` function.
  *Available since 2.31*

- **R** `std_normal_log_qf(T x)`
  Return the value of the inverse standard normal cdf $\Phi^{-1}$ evaluated at the log of the specified quantile x. This function is equivalent to `std_normal_qf(exp(x))` but is more numerically stable.
  *Available since 2.31*

- **real** `std_normal_rng()`
  Generate a normal variate with location zero and scale one; may only be used in transformed data and generated quantities blocks.
  *Available since 2.21*
19.2. Normal-id generalized linear model (linear regression)

Stan also supplies a single function for a generalized linear model with normal likelihood and identity link function, i.e. a function for a linear regression. This provides a more efficient implementation of linear regression than a manually written regression in terms of a normal likelihood and matrix multiplication.

**Probability distribution function**

If \( x \in \mathbb{R}^{n \cdot m}, \alpha \in \mathbb{R}^n, \beta \in \mathbb{R}^m, \sigma \in \mathbb{R}^+ \), then for \( y \in \mathbb{R}^n \),

\[
\text{NormalIdGLM}(y|x, \alpha, \beta, \sigma) = \prod_{1 \leq i \leq n} \text{Normal}(y_i|\alpha_i + x_i \cdot \beta, \sigma).
\]

**Sampling statement**

\( y \sim \text{normal_id_glm}(x, \alpha, \beta, \sigma) \)

Increment target log probability density with \( \text{normal_id_glm_lupdf}(y \mid x, \alpha, \beta, \sigma) \).

*Available since 2.19*

**Stan functions**

- **real** \( \text{normal_id_glm_lpdf}(\text{real } y \mid \text{matrix } x, \text{real } \alpha, \text{vector } \beta, \text{real } \sigma) \)
  
The log normal probability density of \( y \) given location \( \alpha + x \cdot \beta \) and scale \( \sigma \).
  
  *Available since 2.29*

- **real** \( \text{normal_id_glm_lupdf}(\text{real } y \mid \text{matrix } x, \text{real } \alpha, \text{vector } \beta, \text{real } \sigma) \)
  
The log normal probability density of \( y \) given location \( \alpha + x \cdot \beta \) and scale \( \sigma \) dropping constant additive terms.
  
  *Available since 2.29*

- **real** \( \text{normal_id_glm_lpdf}(\text{real } y \mid \text{matrix } x, \text{vector } \alpha, \text{vector } \beta, \text{real } \sigma) \)
  
The log normal probability density of \( y \) given location \( \alpha + x \cdot \beta \) and scale \( \sigma \).
  
  *Available since 2.29*

- **real** \( \text{normal_id_glm_lupdf}(\text{real } y \mid \text{matrix } x, \text{vector } \alpha, \text{vector } \beta, \text{real } \sigma) \)
  
The log normal probability density of \( y \) given location \( \alpha + x \cdot \beta \) and scale \( \sigma \).
  
  *Available since 2.29*
19.2. NORMAL-ID GENERALIZED LINEAR MODEL (LINEAR REGRESSION)

scale sigma dropping constant additive terms.
Available since 2.29

real normal_id_glm_lpdf(real y | matrix x, real alpha, vector beta, vector sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma.
Available since 2.23

real normal_id_glm_lupdf(real y | matrix x, real alpha, vector beta, vector sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma dropping constant additive terms.
Available since 2.25

real normal_id_glm_lpdf(real y | matrix x, vector alpha, vector beta, vector sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma.
Available since 2.23

real normal_id_glm_lupdf(real y | matrix x, vector alpha, vector beta, vector sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma dropping constant additive terms.
Available since 2.25

real normal_id_glm_lpdf(vector y | row_vector x, real alpha, vector beta, real sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma.
Available since 2.29

real normal_id_glm_lupdf(vector y | row_vector x, real alpha, vector beta, real sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma dropping constant additive terms.
Available since 2.29

real normal_id_glm_lpdf(vector y | row_vector x, vector alpha, vector beta, real sigma)
The log normal probability density of y given location alpha + x * beta and scale sigma.
The log normal probability density of $y$ given location $\alpha + x \cdot \beta$ and scale $\sigma$ dropping constant additive terms.

*Available since 2.23*

The log normal probability density of $y$ given location $\alpha + x \cdot \beta$ and scale $\sigma$.

*Available since 2.23*

The log normal probability density of $y$ given location $\alpha + x \cdot \beta$ and scale $\sigma$ dropping constant additive terms.

*Available since 2.23*

The log normal probability density of $y$ given location $\alpha + x \cdot \beta$ and scale $\sigma$.

*Available since 2.30*
scale sigma dropping constant additive terms.

Available since 2.30

real \texttt{normal_id_glm_lpdf}(vector y | matrix x, vector alpha, vector beta, vector sigma)
The log normal probability density of \( y \) given location \( \alpha + x \times \beta \) and scale \( \sigma \).

Available since 2.30

real \texttt{normal_id_glm_lupdf}(vector y | matrix x, vector alpha, vector beta, vector sigma)
The log normal probability density of \( y \) given location \( \alpha + x \times \beta \) and scale \( \sigma \) dropping constant additive terms.

Available since 2.30

19.3. Exponentially modified normal distribution

Probability density function

If \( \mu \in \mathbb{R}, \sigma \in \mathbb{R}^+, \) and \( \lambda \in \mathbb{R}^+ \), then for \( y \in \mathbb{R} \),

\[
\text{ExpModNormal}(y|\mu,\sigma,\lambda) = \frac{\lambda}{2} \exp\left(\frac{\lambda}{2} (2\mu + \lambda \sigma^2 - 2y)\right) \text{erfc}\left(\frac{\mu + \lambda \sigma^2 - y}{\sqrt{2}\sigma}\right).
\]

Sampling statement

\( y \sim \text{exp_mod_normal}(\mu, \sigma, \lambda) \)

Increment target log probability density with \( \text{exp_mod_normal_lupdf}(y | \mu, \sigma, \lambda) \).

Available since 2.0

Stan functions

real \texttt{exp_mod_normal_lpdf}(reals y | reals mu, reals sigma, reals lambda)
The log of the exponentially modified normal density of \( y \) given location \( \mu \), scale \( \sigma \), and shape \( \lambda \)

Available since 2.18

real \texttt{exp_mod_normal_lupdf}(reals y | reals mu, reals sigma, reals lambda)
The log of the exponentially modified normal density of \( y \) given location \( \mu \), scale \( \sigma \), and shape \( \lambda \) dropping constant additive terms

Available since 2.25
real \texttt{exp_mod_normal_cdf}(\texttt{reals y | reals mu, reals sigma, reals lambda})
The exponentially modified normal cumulative distribution function of y given location mu, scale sigma, and shape lambda
\textit{Available since 2.0}

real \texttt{exp_mod_normal_lcdf}(\texttt{reals y | reals mu, reals sigma, reals lambda})
The log of the exponentially modified normal cumulative distribution function of y given location mu, scale sigma, and shape lambda
\textit{Available since 2.18}

real \texttt{exp_mod_normal_lccdf}(\texttt{reals y | reals mu, reals sigma, reals lambda})
The log of the exponentially modified normal complementary cumulative distribution function of y given location mu, scale sigma, and shape lambda
\textit{Available since 2.18}

\texttt{R \texttt{exp_mod_normal_rng}(reals mu, reals sigma, reals lambda)}
Generate a exponentially modified normal variate with location mu, scale sigma, and shape lambda; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.
\textit{Available since 2.18}

\subsection{19.4. Skew normal distribution}

\textbf{Probability density function}

If $\xi \in \mathbb{R}, \omega \in \mathbb{R}^+, \text{and} \alpha \in \mathbb{R}$, then for $y \in \mathbb{R}$,

$$
\text{SkewNormal}(y \mid \xi, \omega, \alpha) = \frac{1}{\omega \sqrt{2\pi}} \exp \left( -\frac{1}{2} \left( \frac{y - \xi}{\omega} \right)^2 \right) \left( 1 + \text{erf} \left( \alpha \left( \frac{y - \xi}{\omega \sqrt{2}} \right) \right) \right).
$$

\textbf{Sampling statement}

$y \sim \texttt{skew\_normal}(\texttt{xi}, \texttt{omega}, \texttt{alpha})$

Increment target log probability density with \texttt{skew\_normal\_lupdf}(y \mid \texttt{xi}, \texttt{omega}, \texttt{alpha}).
\textit{Available since 2.0}
19.5. **STUDENT-T DISTRIBUTION**

**Stan functions**

- `real skew_normal_lpdf(reals y | reals xi, reals omega, reals alpha)`
  The log of the skew normal density of \( y \) given location \( xi \), scale \( omega \), and shape \( alpha \)
  
  *Available since 2.16*

- `real skew_normal_lupdf(reals y | reals xi, reals omega, reals alpha)`
  The log of the skew normal density of \( y \) given location \( xi \), scale \( omega \), and shape \( alpha \) dropping constant additive terms
  
  *Available since 2.25*

- `real skew_normal_cdf(reals y | reals xi, reals omega, reals alpha)`
  The skew normal distribution function of \( y \) given location \( xi \), scale \( omega \), and shape \( alpha \)
  
  *Available since 2.16*

- `real skew_normal_lcdf(reals y | reals xi, reals omega, reals alpha)`
  The log of the skew normal cumulative distribution function of \( y \) given location \( xi \), scale \( omega \), and shape \( alpha \)
  
  *Available since 2.18*

- `real skew_normal_lccdf(reals y | reals xi, reals omega, reals alpha)`
  The log of the skew normal complementary cumulative distribution function of \( y \) given location \( xi \), scale \( omega \), and shape \( alpha \)
  
  *Available since 2.18*

- `R skew_normal_rng(reals xi, reals omega, real alpha)`
  Generate a skew normal variate with location \( xi \), scale \( omega \), and shape \( alpha \); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.
  
  *Available since 2.18*

### 19.5. Student-t distribution

**Probability density function**

If \( \nu \in \mathbb{R}^+ \), \( \mu \in \mathbb{R} \), and \( \sigma \in \mathbb{R}^+ \), then for \( y \in \mathbb{R} \),

\[
\text{StudentT}(y|\nu, \mu, \sigma) = \frac{\Gamma((\nu+1)/2)}{\Gamma(\nu/2)} \frac{1}{\sqrt{\nu\pi}\sigma} \left(1 + \frac{1}{\nu} \left(\frac{y - \mu}{\sigma}\right)^2\right)^{-(\nu+1)/2}.
\]
Sampling statement

\[ y \sim \text{student}_t(\nu, \mu, \sigma) \]

Increment target log probability density with \(\text{student}_t_{\text{lupdf}}(y | \nu, \mu, \sigma)\).

*Available since 2.0*

**Stan functions**

**real** \(\text{student}_t_{\text{lpdf}}\)(reals \(y\) | reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
The log of the Student-\(t\) density of \(y\) given degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\)  
*Available since 2.12*

**real** \(\text{student}_t_{\text{lupdf}}\)(reals \(y\) | reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
The log of the Student-\(t\) density of \(y\) given degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\) dropping constant additive terms  
*Available since 2.25*

**real** \(\text{student}_t_{\text{cdf}}\)(reals \(y\) | reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
The Student-\(t\) cumulative distribution function of \(y\) given degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\)  
*Available since 2.0*

**real** \(\text{student}_t_{\text{lcdf}}\)(reals \(y\) | reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
The log of the Student-\(t\) cumulative distribution function of \(y\) given degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\)  
*Available since 2.12*

**real** \(\text{student}_t_{\text{lccdf}}\)(reals \(y\) | reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
The log of the Student-\(t\) complementary cumulative distribution function of \(y\) given degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\)  
*Available since 2.12*

**R** \(\text{student}_t_{\text{rng}}\)(reals \(\nu\), reals \(\mu\), reals \(\sigma\))  
Generate a Student-\(t\) variate with degrees of freedom \(\nu\), location \(\mu\), and scale \(\sigma\); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.  
*Available since 2.18*
19.6. Cauchy distribution

Probability density function
If $\mu \in \mathbb{R}$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}$,

$$
\text{Cauchy}(y|\mu, \sigma) = \frac{1}{\pi \sigma} \frac{1}{1 + ((y - \mu)/\sigma)^2}.
$$

Sampling statement
$$
y \sim \text{cauchy}(\mu, \sigma)
$$
Increment target log probability density with $\text{cauchy}_\text{lupdf}(y | \mu, \sigma)$.

Available since 2.0

Stan functions

real $\text{cauchy}_\text{lpdf}$(reals $y$ | reals $\mu$, reals $\sigma$)
The log of the Cauchy density of $y$ given location $\mu$ and scale $\sigma$
Available since 2.12

real $\text{cauchy}_\text{lupdf}$(reals $y$ | reals $\mu$, reals $\sigma$)
The log of the Cauchy density of $y$ given location $\mu$ and scale $\sigma$ dropping constant additive terms
Available since 2.25

real $\text{cauchy}_\text{cdf}$(reals $y$ | reals $\mu$, reals $\sigma$)
The Cauchy cumulative distribution function of $y$ given location $\mu$ and scale $\sigma$
Available since 2.0

real $\text{cauchy}_\text{lccdf}$(reals $y$ | reals $\mu$, reals $\sigma$)
The log of the Cauchy complementary cumulative distribution function of $y$ given location $\mu$ and scale $\sigma$
Available since 2.12

real $\text{cauchy}_\text{rng}$(reals $\mu$, reals $\sigma$)
Generate a Cauchy variate with location $\mu$ and scale $\sigma$; may only be used in transformed data and generated quantities blocks. For a description of argument
and return types, see section vectorized PRNG functions. 

Available since 2.18

19.7. Double exponential (Laplace) distribution

Probability density function

If \( \mu \in \mathbb{R} \) and \( \sigma \in \mathbb{R}^+ \), then for \( y \in \mathbb{R} \),

\[
\text{DoubleExponential}(y|\mu, \sigma) = \frac{1}{2\sigma} \exp \left( - \frac{|y - \mu|}{\sigma} \right).
\]

Note that the double exponential distribution is parameterized in terms of the scale, in contrast to the exponential distribution (see section exponential distribution), which is parameterized in terms of inverse scale.

The double-exponential distribution can be defined as a compound exponential-normal distribution (Ding and Blitzstein 2018). Using the inverse scale parameterization for the exponential distribution, and the standard deviation parameterization for the normal distribution, one can write

\[
\alpha \sim \text{Exponential} \left( \frac{1}{2\sigma^2} \right)
\]

and

\[
\beta | \alpha \sim \text{Normal} (\mu, \sqrt{\alpha}),
\]

then

\[
\beta \sim \text{DoubleExponential}(\mu, \sigma).
\]

This may be used to code a non-centered parameterization by taking

\[
\beta^{\text{raw}} \sim \text{Normal}(0, 1)
\]

and defining

\[
\beta = \mu + \sqrt{\alpha} \beta^{\text{raw}}.
\]

Sampling statement

\[
y \sim \text{double_exponential}(\mu, \sigma)
\]

Increment target log probability density with \( \text{double_exponential_lupdf}(y | \mu, \sigma) \).

Available since 2.0
Stan functions

real double_exponential_lpdf(reals y | reals mu, reals sigma)
The log of the double exponential density of y given location mu and scale sigma
*Available since 2.12*

real double_exponential_lupdf(reals y | reals mu, reals sigma)
The log of the double exponential density of y given location mu and scale sigma
dropping constant additive terms
*Available since 2.25*

real double_exponential_cdf(reals y | reals mu, reals sigma)
The double exponential cumulative distribution function of y given location mu
and scale sigma
*Available since 2.0*

real double_exponential_lcdf(reals y | reals mu, reals sigma)
The log of the double exponential cumulative distribution function of y given
location mu and scale sigma
*Available since 2.12*

real double_exponential_lccdf(reals y | reals mu, reals sigma)
The log of the double exponential complementary cumulative distribution function
of y given location mu and scale sigma
*Available since 2.12*

R double_exponential_rng(reals mu, reals sigma)
Generate a double exponential variate with location mu and scale sigma; may only
be used in transformed data and generated quantities blocks. For a description of
argument and return types, see section vectorized PRNG functions.
*Available since 2.18*

19.8. Logistic distribution

Probability density function
If $\mu \in \mathbb{R}$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}$,

$$\text{Logistic}(y|\mu, \sigma) = \frac{1}{\sigma} \exp\left(-\frac{y - \mu}{\sigma}\right) \left(1 + \exp\left(-\frac{y - \mu}{\sigma}\right)\right)^{-2}.$$  

Sampling statement

$y \sim \text{logistic}(\mu, \sigma)$
Increment target log probability density with \texttt{logistic\_lupdf(y | mu, sigma)}. \textit{Available since 2.0}

**Stan functions**

\texttt{real logistic\_lpdf(reals y | reals mu, reals sigma)}

The log of the logistic density of \(y\) given location \(mu\) and scale \(sigma\)

\textit{Available since 2.12}

\texttt{real logistic\_lupdf(reals y | reals mu, reals sigma)}

The log of the logistic density of \(y\) given location \(mu\) and scale \(sigma\) dropping constant additive terms

\textit{Available since 2.25}

\texttt{real logistic\_cdf(reals y | reals mu, reals sigma)}

The logistic cumulative distribution function of \(y\) given location \(mu\) and scale \(sigma\)

\textit{Available since 2.0}

\texttt{real logistic\_lcdf(reals y | reals mu, reals sigma)}

The log of the logistic cumulative distribution function of \(y\) given location \(mu\) and scale \(sigma\)

\textit{Available since 2.12}

\texttt{real logistic\_lccdf(reals y | reals mu, reals sigma)}

The log of the logistic complementary cumulative distribution function of \(y\) given location \(mu\) and scale \(sigma\)

\textit{Available since 2.12}

\texttt{R logistic\_rng(reals mu, reals sigma)}

Generate a logistic variate with location \(mu\) and scale \(sigma\); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

\textit{Available since 2.18}

### 19.9. Gumbel distribution

**Probability density function**

If \(\mu \in \mathbb{R}\) and \(\beta \in \mathbb{R}^+\), then for \(y \in \mathbb{R}\),

\[
\text{Gumbel}(y | \mu, \beta) = \frac{1}{\beta} \exp \left( - \frac{y - \mu}{\beta} - \exp \left( - \frac{y - \mu}{\beta} \right) \right)
\]

**Sampling statement**

\(y \sim \text{gumbel}(\mu, \beta)\)
In the list:

**Increment target log probability density with** `gumbel_lupdf(y | mu, beta)`.

*Available since 2.0*

**Stan functions**

- `real gumbel_lpdf(reals y | reals mu, reals beta)`
  The log of the gumbel density of y given location mu and scale beta
  *Available since 2.12*

- `real gumbel_lupdf(reals y | reals mu, reals beta)`
  The log of the gumbel density of y given location mu and scale beta dropping constant additive terms
  *Available since 2.25*

- `real gumbel_cdf(reals y | reals mu, reals beta)`
  The gumbel cumulative distribution function of y given location mu and scale beta
  *Available since 2.0*

- `real gumbel_lcdf(reals y | reals mu, reals beta)`
  The log of the gumbel cumulative distribution function of y given location mu and scale beta
  *Available since 2.12*

- `real gumbel_lccdf(reals y | reals mu, reals beta)`
  The log of the gumbel complementary cumulative distribution function of y given location mu and scale beta
  *Available since 2.12*

- `R gumbel_rng(reals mu, reals beta)`
  Generate a gumbel variate with location mu and scale beta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.
  *Available since 2.18*

---

### 19.10. Skew double exponential distribution

**Probability density function**

If \( \mu \in \mathbb{R}, \sigma \in \mathbb{R}^+ \) and \( \tau \in [0, 1] \), then for \( y \in \mathbb{R} \),

\[
\text{SkewDoubleExponential}(y | \mu, \sigma, \tau) = \frac{2\tau(1 - \tau)}{\sigma} \exp \left[ -\frac{2}{\sigma} \left[ (1 - \tau) I(y < \mu)(\mu - y) + \tau I(y > \mu)(y - \mu) \right] \right]
\]
Sampling statement

\[ y \sim \text{skew\_double\_exponential}(\mu, \sigma, \tau) \]

Increment target log probability density with \( \text{skew\_double\_exponential}(y | \mu, \sigma, \tau) \)

Available since 2.28

Stan functions

\text{real} \quad \text{skew\_double\_exponential\_lpdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
The log of the skew double exponential density of \( y \) given location \( \mu \), scale \( \sigma \) and skewness \( \tau \)

Available since 2.28

\text{real} \quad \text{skew\_double\_exponential\_lupdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
The log of the skew double exponential density of \( y \) given location \( \mu \), scale \( \sigma \) and skewness \( \tau \) dropping constant additive terms

Available since 2.28

\text{real} \quad \text{skew\_double\_exponential\_cdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
The skew double exponential cumulative distribution function of \( y \) given location \( \mu \), scale \( \sigma \) and skewness \( \tau \)

Available since 2.28

\text{real} \quad \text{skew\_double\_exponential\_lcdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
The log of the skew double exponential cumulative distribution function of \( y \) given location \( \mu \), scale \( \sigma \) and skewness \( \tau \)

Available since 2.28

\text{real} \quad \text{skew\_double\_exponential\_lccdf}(\text{reals } y | \text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
The log of the skew double exponential complementary cumulative distribution function of \( y \) given location \( \mu \), scale \( \sigma \) and skewness \( \tau \)

Available since 2.28

\text{R} \quad \text{skew\_double\_exponential\_rng}(\text{reals } \mu, \text{reals } \sigma, \text{reals } \tau) \\
Generate a skew double exponential variate with location \( \mu \), scale \( \sigma \) and skewness \( \tau \); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized
PRNG functions.

*Available since 2.28*
20. Positive Continuous Distributions

The positive continuous probability functions have support on the positive real numbers.

20.1. Lognormal distribution

Probability density function
If $\mu \in \mathbb{R}$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}^+$,

$$\text{LogNormal}(y|\mu,\sigma) = \frac{1}{\sqrt{2\pi} \sigma} \frac{1}{y} \exp \left(-\frac{1}{2} \left( \frac{\log y - \mu}{\sigma} \right)^2 \right).$$

Sampling statement
$y \sim \text{lognormal}(\mu, \sigma)$

Increment target log probability density with lognormal_lupdf($y \mid \mu, \sigma$).

Available since 2.0

Stan functions

real lognormal_lpdf(reals y | reals mu, reals sigma)
The log of the lognormal density of $y$ given location $\mu$ and scale $\sigma$

Available since 2.12

real lognormal_lupdf(reals y | reals mu, reals sigma)
The log of the lognormal density of $y$ given location $\mu$ and scale $\sigma$ dropping constant additive terms

Available since 2.25

real lognormal_cdf(reals y | reals mu, reals sigma)
The cumulative lognormal distribution function of $y$ given location $\mu$ and scale $\sigma$

Available since 2.0

real lognormal_lcdf(reals y | reals mu, reals sigma)
The log of the lognormal cumulative distribution function of $y$ given location $\mu$ and scale $\sigma$

Available since 2.12
20.2. CHI-SQUARE DISTRIBUTION

real `lognormal_lccdf`(reals y | reals mu, reals sigma)
The log of the lognormal complementary cumulative distribution function of y
given location mu and scale sigma

*Available since 2.12*

R `lognormal_rng`(reals mu, reals sigma)
Generate a lognormal variate with location mu and scale sigma; may only be used
in transformed data and generated quantities blocks. For a description of argument
and return types, see section vectorized PRNG functions.

*Available since 2.22*

### 20.2. Chi-square distribution

**Probability density function**

If $\nu \in \mathbb{R}^+$, then for $y \in \mathbb{R}^+$,

$$
\text{ChiSquare}(y | \nu) = \frac{2^{-\nu/2}}{\Gamma(\nu/2)} y^{\nu/2 - 1} \exp\left(-\frac{1}{2} y\right).
$$

**Sampling statement**

$y \sim \text{chi\_square}(\nu)$

Increment target log probability density with `chi_square_lupdf(y | \nu)`.

*Available since 2.0*

**Stan functions**

real `chi_square_lpdf`(reals y | reals nu)
The log of the Chi-square density of y given degrees of freedom nu

*Available since 2.12*

real `chi_square_lupdf`(reals y | reals nu)
The log of the Chi-square density of y given degrees of freedom nu dropping
constant additive terms

*Available since 2.25*

real `chi_square_cdf`(reals y | reals nu)
The Chi-square cumulative distribution function of y given degrees of freedom nu

*Available since 2.0*

real `chi_square_lcdf`(reals y | reals nu)
The log of the Chi-square cumulative distribution function of y given degrees of
freedom nu

*Available since 2.12*
real \texttt{chi\_square\_lccdf}(\texttt{reals y | reals nu})
The log of the complementary Chi-square cumulative distribution function of y
given degrees of freedom nu
\textit{Available since 2.12}

\texttt{R chi\_square\_rng}(\texttt{reals nu})
Generate a Chi-square variate with degrees of freedom nu; may only be used in
transformed data and generated quantities blocks. For a description of argument
and return types, see section vectorized PRNG functions.
\textit{Available since 2.18}

20.3. \textbf{Inverse chi-square distribution}

\textbf{Probability density function}
If \( \nu \in \mathbb{R}^+ \), then for \( y \in \mathbb{R}^+ \),
\[
\text{InvChiSquare}(y | \nu) = \frac{2^{-\nu/2}}{\Gamma(\nu/2)} y^{-\nu/2-1} \exp\left(-\frac{1}{2} \frac{1}{y}\right).
\]

\textbf{Sampling statement}
\( y \sim \text{inv\_chi\_square}(\nu) \)
Increment target log probability density with \texttt{inv\_chi\_square\_lupdf}(y | \nu).
\textit{Available since 2.0}

\textbf{Stan functions}
real \texttt{inv\_chi\_square\_lpdf}(\texttt{reals y | reals nu})
The log of the inverse Chi-square density of y given degrees of freedom nu
\textit{Available since 2.12}

real \texttt{inv\_chi\_square\_lupdf}(\texttt{reals y | reals nu})
The log of the inverse Chi-square density of y given degrees of freedom nu dropping
constant additive terms
\textit{Available since 2.25}

real \texttt{inv\_chi\_square\_cdf}(\texttt{reals y | reals nu})
The inverse Chi-squared cumulative distribution function of y given degrees of
freedom nu
\textit{Available since 2.0}

real \texttt{inv\_chi\_square\_lcdf}(\texttt{reals y | reals nu})
The log of the inverse Chi-squared cumulative distribution function of y given
degrees of freedom nu

Available since 2.12

`real inv_chi_square_lccdf(reals y | reals nu)`
The log of the inverse Chi-squared complementary cumulative distribution function of y given degrees of freedom nu

Available since 2.12

`R inv_chi_square_rng(reals nu)`
Generate an inverse Chi-squared variate with degrees of freedom nu; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

Available since 2.18

### 20.4. Scaled inverse chi-square distribution

**Probability density function**
If $\nu \in \mathbb{R}^+$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}^+$,

$$\text{ScaledInvChiSquare}(y|\nu,\sigma) = \frac{(\nu/2)^{\nu/2}}{\Gamma(\nu/2)} \sigma^\nu y^{-(\nu/2+1)} \exp\left( - \frac{1}{2} \sigma^2 \frac{1}{y} \right).$$

**Sampling statement**

$y \sim \text{scaled_inv_chi_square}(\nu, \sigma)$

Increment target log probability density with `scaled_inv_chi_square_lupdf(y | nu, sigma)`.

Available since 2.0

**Stan functions**

`real scaled_inv_chi_square_lpdf(reals y | reals nu, reals sigma)`
The log of the scaled inverse Chi-square density of y given degrees of freedom nu and scale sigma

Available since 2.12

`real scaled_inv_chi_square_lupdf(reals y | reals nu, reals sigma)`
The log of the scaled inverse Chi-square density of y given degrees of freedom nu and scale sigma dropping constant additive terms

Available since 2.25

`real scaled_inv_chi_square_cdf(reals y | reals nu, reals sigma)`
The scaled inverse Chi-square cumulative distribution function of y given degrees
of freedom \( \nu \) and scale \( \sigma \)

\[ \text{Scaled Inv-Chi-Square LCDF} \ (y | \nu, \sigma) \]
The log of the scaled inverse Chi-square cumulative distribution function of \( y \) given degrees of freedom \( \nu \) and scale \( \sigma \)

\[ \text{Scaled Inv-Chi-Square LCCDF} \ (y | \nu, \sigma) \]
The log of the scaled inverse Chi-square complementary cumulative distribution function of \( y \) given degrees of freedom \( \nu \) and scale \( \sigma \)

\[ \text{Scaled Inv-Chi-Square RNG} \ (\nu, \sigma) \]
Generate a scaled inverse Chi-squared variate with degrees of freedom \( \nu \) and scale \( \sigma \); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

\[ \text{Exponential distribution} \]

Probability density function
If \( \beta \in \mathbb{R}^+ \), then for \( y \in \mathbb{R}^+ \),

\[ \text{Exponential}(y|\beta) = \beta \exp(-\beta y). \]

Sampling statement
\( y \sim \text{exponential}(\beta) \)
Increment target log probability density with \( \text{exponential_lupdf}(y \mid \beta) \).

Stan functions
\[ \text{Real exponential_lpdf}(y \mid \beta) \]
The log of the exponential density of \( y \) given inverse scale \( \beta \)

\[ \text{Real exponential_lupdf}(y \mid \beta) \]
The log of the exponential density of \( y \) given inverse scale \( \beta \) dropping constant additive terms

\[ \text{Real exponential_cdf}(y \mid \beta) \]
20.6. GAMMA DISTRIBUTION

The exponential cumulative distribution function of y given inverse scale beta

\textit{Available since 2.0}

\texttt{real \textbf{exponential\_lcdf}(reals y | reals beta)}

The log of the exponential cumulative distribution function of y given inverse scale beta

\textit{Available since 2.12}

\texttt{real \textbf{exponential\_lccdf}(reals y | reals beta)}

The log of the exponential complementary cumulative distribution function of y given inverse scale beta

\textit{Available since 2.12}

\texttt{R \textbf{exponential\_rng}(reals beta)}

Generate an exponential variate with inverse scale beta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

\textit{Available since 2.18}

20.6. Gamma distribution

Probability density function

If \( \alpha \in \mathbb{R}^+ \) and \( \beta \in \mathbb{R}^+ \), then for \( y \in \mathbb{R}^+ \),

\[
\text{Gamma}(y|\alpha, \beta) = \frac{\beta^\alpha}{\Gamma(\alpha)} y^{\alpha-1} \exp(-\beta y).
\]

Sampling statement

\( y \sim \text{gamma}(alpha, beta) \)

Increment target log probability density with \( \text{gamma\_lupdf}(y | alpha, beta) \).

\textit{Available since 2.0}

Stan functions

\texttt{real \textbf{gamma\_lpdf}(reals y | reals alpha, reals beta)}

The log of the gamma density of y given shape alpha and inverse scale beta

\textit{Available since 2.12}

\texttt{real \textbf{gamma\_lupdf}(reals y | reals alpha, reals beta)}

The log of the gamma density of y given shape alpha and inverse scale beta dropping constant additive terms

\textit{Available since 2.25}
real \textbf{gamma}_\text{cdf}(\text{reals } y \mid \text{reals } \alpha, \text{reals } \beta)

The cumulative gamma distribution function of \(y\) given shape \(\alpha\) and inverse scale \(\beta\)

\textit{Available since 2.0}

real \textbf{gamma}_\text{lcdf}(\text{reals } y \mid \text{reals } \alpha, \text{reals } \beta)

The log of the cumulative gamma distribution function of \(y\) given shape \(\alpha\) and inverse scale \(\beta\)

\textit{Available since 2.12}

real \textbf{gamma}_\text{lccdf}(\text{reals } y \mid \text{reals } \alpha, \text{reals } \beta)

The log of the complementary cumulative gamma distribution function of \(y\) given shape \(\alpha\) and inverse scale \(\beta\)

\textit{Available since 2.12}

\textbf{R}\textbf{gamma}_\text{rng}(\text{reals } \alpha, \text{reals } \beta)

Generate a gamma variate with shape \(\alpha\) and inverse scale \(\beta\); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

\textit{Available since 2.18}

20.7. Inverse gamma Distribution

Probability density function

If \(\alpha \in \mathbb{R}^+\) and \(\beta \in \mathbb{R}^+\), then for \(y \in \mathbb{R}^+\),

\[
\text{InvGamma}(y|\alpha, \beta) = \frac{\beta^\alpha}{\Gamma(\alpha)} y^{-(\alpha+1)} \exp\left(-\beta \frac{1}{y}\right).
\]

Sampling statement

\(y \sim \textbf{inv\_gamma}(\alpha, \beta)\)

Increment target log probability density with \textbf{inv\_gamma}_\text{lupdf}(y \mid \alpha, \beta).

\textit{Available since 2.0}

\textbf{Stan functions}

real \textbf{inv\_gamma}\_lpdf(\text{reals } y \mid \text{reals } \alpha, \text{reals } \beta)

The log of the inverse gamma density of \(y\) given shape \(\alpha\) and scale \(\beta\)

\textit{Available since 2.12}

real \textbf{inv\_gamma}\_lupdf(\text{reals } y \mid \text{reals } \alpha, \text{reals } \beta)

The log of the inverse gamma density of \(y\) given shape \(\alpha\) and scale \(\beta\) dropping
20.8. **WEIBULL DISTRIBUTION**

**Probability density function**
If $\alpha \in \mathbb{R}^+$ and $\sigma \in \mathbb{R}^+$, then for $y \in [0, \infty)$,

\[
\text{Weibull}(y|\alpha, \sigma) = \frac{\alpha}{\sigma} \left(\frac{y}{\sigma}\right)^{\alpha-1} \exp\left(-\left(\frac{y}{\sigma}\right)^\alpha\right).
\]

Note that if $Y \sim \text{Weibull}(\alpha, \sigma)$, then $Y^{-1} \sim \text{Frechet}(\alpha, \sigma^{-1})$.

**Sampling statement**
\[y \sim \text{weibull}(\alpha, \sigma)\]

Increment target log probability density with \texttt{weibull_lupdf(y | alpha, sigma)}.

*Available since 2.0*

**Stan functions**

\[
\text{real weibull_lpdf(reals y | reals alpha, reals sigma)}
\]

The log of the Weibull density of $y$ given shape alpha and scale sigma.

*Available since 2.18*
real weibull_lupdf(reals y | reals alpha, reals sigma)
The log of the Weibull density of y given shape alpha and scale sigma dropping constant additive terms
Available since 2.25
real weibull_cdf(reals y | reals alpha, reals sigma)
The Weibull cumulative distribution function of y given shape alpha and scale sigma
Available since 2.0
real weibull_lcdf(reals y | reals alpha, reals sigma)
The log of the Weibull cumulative distribution function of y given shape alpha and scale sigma
Available since 2.12
real weibull_lccdf(reals y | reals alpha, reals sigma)
The log of the Weibull complementary cumulative distribution function of y given shape alpha and scale sigma
Available since 2.12
R weibull_rng(reals alpha, reals sigma)
Generate a weibull variate with shape alpha and scale sigma; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.
Available since 2.18

20.9. Frechet distribution

Probability density function
If $\alpha \in \mathbb{R}^+$ and $\sigma \in \mathbb{R}^+$, then for $y \in \mathbb{R}^+$,
\[
\text{Frechet}(y|\alpha, \sigma) = \frac{\alpha}{\sigma} \left( \frac{y}{\sigma} \right)^{-\alpha-1} \exp \left( - \left( \frac{y}{\sigma} \right)^{-\alpha} \right).
\]

Note that if $Y \sim \text{Frechet}(\alpha, \sigma)$, then $Y^{-1} \sim \text{Weibull}(\alpha, \sigma^{-1})$.

Sampling statement
\[
y \sim \text{frechet}(\text{alpha}, \text{sigma})
\]
Increment target log probability density with frechet_lupdf(y | alpha, sigma).
Available since 2.5
Stan functions

```stan
real frechet_lpdf(reals y | reals alpha, reals sigma)
The log of the Frechet density of y given shape alpha and scale sigma
Available since 2.12

real frechet_lupdf(reals y | reals alpha, reals sigma)
The log of the Frechet density of y given shape alpha and scale sigma dropping
constant additive terms
Available since 2.25

real frechet_cdf(reals y | reals alpha, reals sigma)
The Frechet cumulative distribution function of y given shape alpha and scale sigma
Available since 2.5

real frechet_lcdf(reals y | reals alpha, reals sigma)
The log of the Frechet cumulative distribution function of y given shape alpha and
scale sigma
Available since 2.12

real frechet_lccdf(reals y | reals alpha, reals sigma)
The log of the Frechet complementary cumulative distribution function of y given
shape alpha and scale sigma
Available since 2.12

R frechet_rng(reals alpha, reals sigma)
Generate a Frechet variate with shape alpha and scale sigma; may only be used in
transformed data and generated quantities blocks. For a description of argument
and return types, see section vectorized PRNG functions.
Available since 2.18
```

20.10. Rayleigh distribution

Probability density function
If $\sigma \in \mathbb{R}^+$, then for $y \in [0, \infty)$,

$$
\text{Rayleigh}(y|\sigma) = \frac{y}{\sigma^2} \exp\left(-\frac{y^2}{2\sigma^2}\right).
$$

Sampling statement

$y \sim \text{rayleigh}(\text{sigma})$

Increment target log probability density with `rayleigh_lupdf(y | sigma)`.
Available since 2.0
Stan functions

real rayleigh_lpdf(reals y | reals sigma)
The log of the Rayleigh density of y given scale sigma
Available since 2.12

real rayleigh_lupdf(reals y | reals sigma)
The log of the Rayleigh density of y given scale sigma dropping constant additive terms
Available since 2.25

real rayleigh_cdf(real y | real sigma)
The Rayleigh cumulative distribution of y given scale sigma
Available since 2.0

real rayleigh_lcdf(real y | real sigma)
The log of the Rayleigh cumulative distribution of y given scale sigma
Available since 2.12

real rayleigh_lccdf(real y | real sigma)
The log of the Rayleigh complementary cumulative distribution of y given scale sigma
Available since 2.12

R rayleigh_rng(reals sigma)
Generate a Rayleigh variate with scale sigma; may only be used in generated quantities block. For a description of argument and return types, see section vectorized PRNG functions.
Available since 2.18

20.11. Log-logistic distribution

Probability density function
If $\alpha, \beta \in \mathbb{R}^+$, then for $y \in \mathbb{R}^+$,

$$\text{Log-Logistic}(y | \alpha, \beta) = \frac{(\frac{\beta}{\alpha}) \left(\frac{y}{\alpha}\right)^{\beta-1}}{\left(1 + \left(\frac{y}{\alpha}\right)^{\beta}\right)^2}.$$ 

Sampling statement

$y \sim \text{loglogistic}(\alpha, \beta)$

Increment target log probability density with unnormalized version of loglogistic_lpdf($y | \alpha, \beta$)
20.11. LOG-LOGISTIC DISTRIBUTION

Available since 2.29

Stan functions

real `loglogistic_lpdf`(reals y | reals alpha, reals beta)
The log of the log-logistic density of y given scale alpha and shape beta
Available since 2.29

real `loglogistic_cdf`(reals y | reals alpha, reals beta)
The log-logistic cumulative distribution function of y given scale alpha and shape beta
Available since 2.29

R `loglogistic_rng`(reals alpha, reals beta)
Generate a log-logistic variate with scale alpha and shape beta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.
Available since 2.29
21. Positive Lower-Bounded Distributions

The positive lower-bounded probabilities have support on real values above some positive minimum value.

21.1. Pareto distribution

Probability density function
If \( y_{\text{min}} \in \mathbb{R}^+ \) and \( \alpha \in \mathbb{R}^+ \), then for \( y \in \mathbb{R}^+ \) with \( y \geq y_{\text{min}} \),

\[
\text{Pareto}(y|y_{\text{min}}, \alpha) = \frac{\alpha y_{\text{min}}^{\alpha}}{y^{\alpha+1}}.
\]

Sampling statement
\[
y \sim \text{pareto}(y_{\text{min}}, \alpha)
\]
Increment target log probability density with pareto_lupdf\( (y | y_{\text{min}}, \alpha) \).

Available since 2.0

Stan functions

real \texttt{pareto_lpdf}(reals y | reals y_{\text{min}}, reals alpha)
The log of the Pareto density of y given positive minimum value y_{\text{min}} and shape alpha

Available since 2.12

real \texttt{pareto_lupdf}(reals y | reals y_{\text{min}}, reals alpha)
The log of the Pareto density of y given positive minimum value y_{\text{min}} and shape alpha dropping constant additive terms

Available since 2.25

real \texttt{pareto_cdf}(reals y | reals y_{\text{min}}, reals alpha)
The Pareto cumulative distribution function of y given positive minimum value y_{\text{min}} and shape alpha

Available since 2.0

real \texttt{pareto_lcdf}(reals y | reals y_{\text{min}}, reals alpha)
The log of the Pareto cumulative distribution function of y given positive minimum value y_{\text{min}} and shape alpha

Available since 2.12
21.2. PARETO TYPE 2 DISTRIBUTION

real \texttt{pareto_lccdf}(\text{reals \(y\mid\text{reals \(y_{\text{min}}\), \text{reals \(\alpha\)}}\})

The log of the Pareto complementary cumulative distribution function of \(y\) given positive minimum value \(y_{\text{min}}\) and shape \(\alpha\)

Available since 2.12

\texttt{R pareto_rng}(\text{reals \(y_{\text{min}}\), \text{reals \(\alpha\)}})

Generate a Pareto variate with positive minimum value \(y_{\text{min}}\) and shape \(\alpha\); may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

Available since 2.18

21.2. Pareto type 2 distribution

Probability density function

If \(\mu \in \mathbb{R}, \lambda \in \mathbb{R}^+, \text{ and } \alpha \in \mathbb{R}^+\), then for \(y \geq \mu\),

\[
\text{Pareto-Type-2}(y|\mu, \lambda, \alpha) = \frac{\alpha \lambda}{\lambda} \left(1 + \frac{y - \mu}{\lambda}\right)^{-(\alpha+1)}.
\]

Note that the Lomax distribution is a Pareto Type 2 distribution with \(\mu = 0\).

Sampling statement

\(y \sim \text{pareto\_type\_2}(\mu, \lambda, \alpha)\)

Increment target log probability density with \texttt{pareto\_type\_2\_lupdf}(y | \mu, \lambda, \alpha).

Available since 2.5

Stan functions

real \texttt{pareto\_type\_2\_lpdf}(\text{reals \(y\mid\text{reals \(\mu\), \text{reals \(\lambda\), \text{reals \(\alpha\)}}\)})

The log of the Pareto Type 2 density of \(y\) given location \(\mu\), scale \(\lambda\), and shape \(\alpha\)

Available since 2.18

real \texttt{pareto\_type\_2\_lupdf}(\text{reals \(y\mid\text{reals \(\mu\), \text{reals \(\lambda\), \text{reals \(\alpha\)}}\)})

The log of the Pareto Type 2 density of \(y\) given location \(\mu\), scale \(\lambda\), and shape \(\alpha\) dropping constant additive terms

Available since 2.25

real \texttt{pareto\_type\_2\_cdf}(\text{reals \(y\mid\text{reals \(\mu\), \text{reals \(\lambda\), \text{reals \(\alpha\)}}\)})
The Pareto Type 2 cumulative distribution function of $y$ given location $\mu$, scale $\lambda$, and shape $\alpha$

*Available since 2.5*

```stan
real pareto_type_2_lcdf(reals y | reals mu, reals lambda, reals alpha)
```

The log of the Pareto Type 2 cumulative distribution function of $y$ given location $\mu$, scale $\lambda$, and shape $\alpha$

*Available since 2.18*

```stan
real pareto_type_2_lccdf(reals y | reals mu, reals lambda, reals alpha)
```

The log of the Pareto Type 2 complementary cumulative distribution function of $y$ given location $\mu$, scale $\lambda$, and shape $\alpha$

*Available since 2.18*

```stan
R pareto_type_2_rng(reals mu, reals lambda, reals alpha)
```

Generate a Pareto Type 2 variate with location $\mu$, scale $\lambda$, and shape $\alpha$; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

*Available since 2.18*

### 21.3. Wiener First Passage Time Distribution

#### Probability density function

If $\alpha \in \mathbb{R}^+$, $\tau \in \mathbb{R}^+$, $\beta \in [0, 1]$ and $\delta \in \mathbb{R}$, then for $y > \tau$,

$$
\text{Wiener}(y|\alpha, \tau, \beta, \delta) = \frac{\alpha^3}{(y - \tau)^{3/2}} \exp\left(-\delta \alpha \beta - \frac{\delta^2(y - \tau)}{2}\right) \sum_{k=-\infty}^{\infty} (2k + \beta) \phi\left(\frac{2k \alpha + \beta}{\sqrt{y - \tau}}\right)
$$

where $\phi(x)$ denotes the standard normal density function; see (Feller 1968), (Navarro and Fuss 2009).

#### Sampling statement

$y \sim \text{wiener}(\alpha, \tau, \beta, \delta)$

Increment target log probability density with `wiener_lupdf(y | alpha, tau, beta, delta)`.

*Available since 2.7*

#### Stan functions

```stan
real wiener_lpdf(reals y | reals alpha, reals tau, reals beta, reals delta)
```
The log of the Wiener first passage time density of y given boundary separation alpha, non-decision time tau, a-priori bias beta and drift rate delta
*Available since 2.18*

\[
\text{real } \text{wiener_lupdf}(\text{reals } y \mid \text{reals } \alpha, \tau, \beta, \delta)
\]

The log of the Wiener first passage time density of y given boundary separation alpha, non-decision time tau, a-priori bias beta and drift rate delta dropping constant additive terms
*Available since 2.25*

**Boundaries**
Stan returns the first passage time of the accumulation process over the upper boundary only. To get the result for the lower boundary, use

\[
\text{Wiener}(y \mid \alpha, \tau, 1 - \beta, -\delta)
\]

For more details, see the appendix of Vandekerckhove and Wabersich (2014).
22. Continuous Distributions on \([0, 1]\)

The continuous distributions with outcomes in the interval \([0, 1]\) are used to characterized bounded quantities, including probabilities.

22.1. Beta distribution

Probability density function
If \(\alpha \in \mathbb{R}^+\) and \(\beta \in \mathbb{R}^+\), then for \(\theta \in (0, 1)\),

\[\text{Beta}(\theta | \alpha, \beta) = \frac{1}{B(\alpha, \beta)} \theta^{\alpha-1} (1 - \theta)^{\beta-1},\]

where the beta function \(B()\) is as defined in section combinatorial functions.

**Warning:** If \(\theta = 0\) or \(\theta = 1\), then the probability is 0 and the log probability is \(-\infty\). Similarly, the distribution requires strictly positive parameters, \(\alpha, \beta > 0\).

Sampling statement
\[\text{theta} \sim \text{beta}(\alpha, \beta)\]

Increment target log probability density with \(\text{beta_lupdf}(\text{theta} | \alpha, \beta)\).

*Available since 2.0*

**Stan functions**

- real \(\text{beta_lpdf}(\text{reals theta} | \text{reals alpha, beta})\)
The log of the beta density of theta in \([0, 1]\) given positive prior successes (plus one) alpha and prior failures (plus one) beta

*Available since 2.12*

- real \(\text{beta_lupdf}(\text{reals theta} | \text{reals alpha, beta})\)
The log of the beta density of theta in \([0, 1]\) given positive prior successes (plus one) alpha and prior failures (plus one) beta dropping constant additive terms

*Available since 2.25*

- real \(\text{beta_cdf}(\text{reals theta} | \text{reals alpha, beta})\)
The beta cumulative distribution function of theta in \([0, 1]\) given positive prior successes (plus one) alpha and prior failures (plus one) beta

*Available since 2.0*
22.2. BETA PROPORTION DISTRIBUTION

real **beta_lcdf**(reals theta | reals alpha, reals beta)
The log of the beta cumulative distribution function of theta in [0,1] given positive prior successes (plus one) alpha and prior failures (plus one) beta

*Available since 2.12*

real **beta_lccdf**(reals theta | reals alpha, reals beta)
The log of the beta complementary cumulative distribution function of theta in [0,1] given positive prior successes (plus one) alpha and prior failures (plus one) beta

*Available since 2.12*

R **beta_rng**(reals alpha, reals beta)
Generate a beta variate with positive prior successes (plus one) alpha and prior failures (plus one) beta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

*Available since 2.18*

### 22.2. Beta proportion distribution

**Probability density function**

If \( \mu \in (0,1) \) and \( \kappa \in \mathbb{R}^+ \), then for \( \theta \in (0,1) \),

\[
\text{Beta-Proportion}(\theta | \mu, \kappa) = \frac{1}{B(\mu \kappa, (1 - \mu) \kappa)} \theta^{\mu \kappa - 1} (1 - \theta)^{(1 - \mu) \kappa - 1},
\]

where the beta function \( B() \) is as defined in section combinatorial functions.

**Warning:** If \( \theta = 0 \) or \( \theta = 1 \), then the probability is 0 and the log probability is \(-\infty\). Similarly, the distribution requires \( \mu \in (0,1) \) and strictly positive parameter, \( \kappa > 0 \).

**Sampling statement**

\( \theta \sim \text{beta_proportion}(\mu, \kappa) \)

Increment target log probability density with \( \text{beta_proportion_lupdf}(\theta | \mu, \kappa) \).

*Available since 2.19*

**Stan functions**

real **beta_proportion_lpdf**(reals theta | reals mu, reals kappa)
The log of the beta proportion density of theta in (0,1) given mean mu and precision kappa

*Available since 2.19*
real `beta_proportion_lupdf`(reals theta | reals mu, reals kappa)
The log of the beta_proportion density of theta in (0,1) given mean mu and precision kappa dropping constant additive terms

*Available since 2.25*

real `beta_proportion_lcdf`(reals theta | reals mu, reals kappa)
The log of the beta_proportion cumulative distribution function of theta in (0,1) given mean mu and precision kappa

*Available since 2.18*

real `beta_proportion_lccdf`(reals theta | reals mu, reals kappa)
The log of the beta_proportion complementary cumulative distribution function of theta in (0,1) given mean mu and precision kappa

*Available since 2.18*

R `beta_proportion_rng`(reals mu, reals kappa)
Generate a beta_proportion variate with mean mu and precision kappa; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

*Available since 2.18*
23. Circular Distributions

Circular distributions are defined for finite values $y$ in any interval of length $2\pi$.

23.1. Von Mises distribution

**Probability density function**

If $\mu \in \mathbb{R}$ and $\kappa \in \mathbb{R}^+$, then for $y \in \mathbb{R}$,

$$
\text{VonMises}(y|\mu, \kappa) = \frac{\exp(\kappa \cos(y - \mu))}{2\pi I_0(\kappa)}.
$$

In order for this density to properly normalize, $y$ must be restricted to some interval $(c, c + 2\pi)$ of length $2\pi$, because

$$
\int_c^{c+2\pi} \text{VonMises}(y|\mu, \kappa)dy = 1.
$$

Similarly, if $\mu$ is a parameter, it will typically be restricted to the same range as $y$.

If $\kappa > 0$, a von Mises distribution with its $2\pi$ interval of support centered around its location $\mu$ will have a single mode at $\mu$; for example, restricting $y$ to $(-\pi, \pi)$ and taking $\mu = 0$ leads to a single local optimum at the mode $\mu$. If the location $\mu$ is not in the center of the support, the density is circularly translated and there will be a second local maximum at the boundary furthest from the mode. Ideally, the parameterization and support will be set up so that the bulk of the probability mass is in a continuous interval around the mean $\mu$.

For $\kappa = 0$, the Von Mises distribution corresponds to the circular uniform distribution with density $1/(2\pi)$ (independently of the values of $y$ or $\mu$).

**Sampling statement**

$$
y \sim \text{von_mises}(\mu, \kappa)
$$

Increment target log probability density with \text{von_mises_lupdf}(y \mid \mu, \kappa).

*Available since 2.0*

**Stan functions**

real \text{von_mises_lpdf}(reals y \mid reals \mu, reals \kappa)
The log of the von mises density of $y$ given location $\mu$ and scale $\kappa$.

*Available since 2.18*
real `von_mises_lupdf`(reals y | reals mu, reals kappa)
The log of the von mises density of y given location mu and scale kappa dropping
constant additive terms.

*Available since 2.25*

real `von_mises_cdf`(reals y | reals mu, reals kappa)
The von mises cumulative distribution function of y given location mu and scale kappa.

*Available since 2.29*

real `von_mises_lcdf`(reals y | reals mu, reals kappa)
The log of the von mises cumulative distribution function of y given location mu
and scale kappa.

*Available since 2.29*

real `von_mises_lccdf`(reals y | reals mu, reals kappa)
The log of the von mises complementary cumulative distribution function of y
given location mu and scale kappa.

*Available since 2.29*

R `von_mises_rng`(reals mu, reals kappa)
Generate a Von Mises variate with location mu and scale kappa (i.e. returns values
in the interval \([((\mu \mod 2\pi) - \pi, (\mu \mod 2\pi) + \pi)]\); may only be used in trans-
formed data and generated quantities blocks. For a description of argument and
return types, see section vectorized PRNG functions.

*Available since 2.18*

**Numerical stability**
Evaluating the Von Mises distribution for \(\kappa > 100\) is numerically unstable in the
current implementation. Nathanael I. Lichti suggested the following workaround
on the Stan users group, based on the fact that as \(\kappa \to \infty\),

\[
\text{VonMises}(y|\mu, \kappa) \to \text{Normal}(\mu, \sqrt{1/\kappa}).
\]

The workaround is to replace \(y \sim \text{von_mises}(\mu, \kappa)\) with

```
if (kappa < 100) {
    y ~ von_mises(mu, kappa);
} else {
    y ~ normal(mu, sqrt(1 / kappa));
}
```
24. Bounded Continuous Distributions

The bounded continuous probabilities have support on a finite interval of real numbers.

24.1. Uniform distribution

Probability density function
If $\alpha \in \mathbb{R}$ and $\beta \in (\alpha, \infty)$, then for $y \in [\alpha, \beta]$,

$$\text{Uniform}(y|\alpha, \beta) = \frac{1}{\beta - \alpha}.$$

Sampling statement
$y \sim \text{uniform}(\alpha, \beta)$

Increment target log probability density with $\text{uniform}_\text{lupdf}(y \mid \alpha, \beta)$.

Available since 2.0

Stan functions

- `real uniform_lpdf(reals y | reals alpha, reals beta)`
  The log of the uniform density of $y$ given lower bound $\alpha$ and upper bound $\beta$
  Available since 2.12

- `real uniform_lupdf(reals y | reals alpha, reals beta)`
  The log of the uniform density of $y$ given lower bound $\alpha$ and upper bound $\beta$ dropping constant additive terms
  Available since 2.25

- `real uniform_cdf(reals y | reals alpha, reals beta)`
  The uniform cumulative distribution function of $y$ given lower bound $\alpha$ and upper bound $\beta$
  Available since 2.0

- `real uniform_lcdf(reals y | reals alpha, reals beta)`
  The log of the uniform cumulative distribution function of $y$ given lower bound $\alpha$ and upper bound $\beta$
  Available since 2.12
real `uniform_lccdf`(reals y | reals alpha, reals beta)
The log of the uniform complementary cumulative distribution function of y given lower bound alpha and upper bound beta

*Available since 2.12*

R `uniform_rng`(reals alpha, reals beta)
Generate a uniform variate with lower bound alpha and upper bound beta; may only be used in transformed data and generated quantities blocks. For a description of argument and return types, see section vectorized PRNG functions.

*Available since 2.18*
25. Distributions over Unbounded Vectors

The unbounded vector probability distributions have support on all of \( \mathbb{R}^K \) for some fixed \( K \).

25.1. Multivariate normal distribution

Probability density function

If \( K \in \mathbb{N}, \mu \in \mathbb{R}^K, \) and \( \Sigma \in \mathbb{R}^{K \times K} \) is symmetric and positive definite, then for \( y \in \mathbb{R}^K, \)

\[
\text{MultiNormal}(y|\mu, \Sigma) = \frac{1}{(2\pi)^{K/2}} \frac{1}{\sqrt{|\Sigma|}} \exp\left(-\frac{1}{2} (y - \mu)^\top \Sigma^{-1} (y - \mu)\right),
\]

where \( |\Sigma| \) is the absolute determinant of \( \Sigma. \)

Sampling statement

\( y \sim \text{multi_normal} (\mu, \Sigma) \)

Increment target log probability density with \( \text{multi_normal_lupdf}(y \mid \mu, \Sigma) \).

Available since 2.0

Stan functions

The multivariate normal probability function is overloaded to allow the variate vector \( y \) and location vector \( \mu \) to be vectors or row vectors (or to mix the two types). The density function is also vectorized, so it allows arrays of row vectors or vectors as arguments; see section vectorized function signatures for a description of vectorization.

real \( \text{multi_normal_lpdf}(\text{vectors } y \mid \text{vectors } \mu, \text{matrix } \Sigma) \)

The log of the multivariate normal density of vector(s) \( y \) given location vector(s) \( \mu \) and covariance matrix \( \Sigma \)

Available since 2.12

real \( \text{multi_normal_lupdf}(\text{vectors } y \mid \text{vectors } \mu, \text{matrix } \Sigma) \)

The log of the multivariate normal density of vector(s) \( y \) given location vector(s) \( \mu \) and covariance matrix \( \Sigma \) dropping constant additive terms

Available since 2.25
real \texttt{multi\_normal\_lpdf}(vectors y | row_vectors mu, matrix Sigma)
The log of the multivariate normal density of vector(s) y given location row vector(s)
mu and covariance matrix Sigma
\textit{Available since 2.12}

real \texttt{multi\_normal\_lupdf}(vectors y | row_vectors mu, matrix Sigma)
The log of the multivariate normal density of vector(s) y given location row vector(s)
mu and covariance matrix Sigma dropping constant additive terms
\textit{Available since 2.25}

real \texttt{multi\_normal\_lpdf}(row_vectors y | vectors mu, matrix Sigma)
The log of the multivariate normal density of row vector(s) y given location vector(s)
mu and covariance matrix Sigma
\textit{Available since 2.12}

real \texttt{multi\_normal\_lupdf}(row_vectors y | vectors mu, matrix Sigma)
The log of the multivariate normal density of row vector(s) y given location vector(s)
mu and covariance matrix Sigma dropping constant additive terms
\textit{Available since 2.25}

real \texttt{multi\_normal\_lpdf}(row_vectors y | row_vectors mu, matrix Sigma)
The log of the multivariate normal density of row vector(s) y given location row
vector(s) mu and covariance matrix Sigma
\textit{Available since 2.12}

real \texttt{multi\_normal\_lupdf}(row_vectors y | row_vectors mu, matrix Sigma)
The log of the multivariate normal density of row vector(s) y given location row
vector(s) mu and covariance matrix Sigma dropping constant additive terms
\textit{Available since 2.25}

Although there is a direct multi-normal RNG function, if more than one result is
required, it’s much more efficient to Cholesky factor the covariance matrix and call
\texttt{multi\_normal\_cholesky\_rng}; see section multi-variate normal, cholesky parame-
terization.

\texttt{vector multi\_normal\_rng}(vector mu, matrix Sigma)
Generate a multivariate normal variate with location mu and covariance matrix Sigma;
may only be used in transformed data and generated quantities blocks
\textit{Available since 2.0}

\texttt{vector multi\_normal\_rng}(row_vector mu, matrix Sigma)
Generate a multivariate normal variate with location mu and covariance matrix Sigma; may only be used in transformed data and generated quantities blocks

Available since 2.18

vectors `multi_normal_rng`(vectors mu, matrix Sigma)
Generate an array of multivariate normal variates with locations mu and covariance matrix Sigma; may only be used in transformed data and generated quantities blocks

Available since 2.18

vectors `multi_normal_rng`(row_vectors mu, matrix Sigma)
Generate an array of multivariate normal variates with locations mu and covariance matrix Sigma; may only be used in transformed data and generated quantities blocks

Available since 2.18

25.2. Multivariate normal distribution, precision parameterization

Probability density function
If $K \in \mathbb{N}$, $\mu \in \mathbb{R}^K$, and $\Omega \in \mathbb{R}^{K \times K}$ is symmetric and positive definite, then for $y \in \mathbb{R}^K$,

$$\text{MultiNormalPrecision}(y|\mu, \Omega) = \text{MultiNormal}(y|\mu, \Omega^{-1})$$

Sampling statement

$y \sim \text{multi_normal_prec}(\mu, \Omega)$

Increment target log probability density with `multi_normal_prec_lupdf`(y | mu, Omega).

Available since 2.3

Stan functions

real `multi_normal_prec_lpdf`(vectors y | vectors mu, matrix Omega)
The log of the multivariate normal density of vector(s) y given location vector(s) mu and positive definite precision matrix Omega

Available since 2.18

real `multi_normal_prec_lupdf`(vectors y | vectors mu, matrix Omega)
The log of the multivariate normal density of vector(s) y given location vector(s) mu and positive definite precision matrix Omega dropping constant additive terms

Available since 2.25
real  \texttt{multi_normal_prec_lpdf(\texttt{vectors y | row_vectors mu, matrix Omega)}}

The log of the multivariate normal density of vector(s) $y$ given location row vector(s) $\mu$ and positive definite precision matrix $\Omega$

\textit{Available since 2.18}

real  \texttt{multi_normal_prec_lupdf(\texttt{vectors y | row_vectors mu, matrix Omega)}}

The log of the multivariate normal density of vector(s) $y$ given location row vector(s) $\mu$ and positive definite precision matrix $\Omega$ dropping constant additive terms

\textit{Available since 2.25}

real  \texttt{multi_normal_prec_lpdf(\texttt{row_vectors y | vectors mu, matrix Omega)}}

The log of the multivariate normal density of row vector(s) $y$ given location vector(s) $\mu$ and positive definite precision matrix $\Omega$

\textit{Available since 2.18}

real  \texttt{multi_normal_prec_lupdf(\texttt{row_vectors y | vectors mu, matrix Omega)}}

The log of the multivariate normal density of row vector(s) $y$ given location vector(s) $\mu$ and positive definite precision matrix $\Omega$ dropping constant additive terms

\textit{Available since 2.25}

real  \texttt{multi_normal_prec_lpdf(\texttt{row_vectors y | row_vectors mu, matrix Omega)}}

The log of the multivariate normal density of row vector(s) $y$ given location row vector(s) $\mu$ and positive definite precision matrix $\Omega$

\textit{Available since 2.18}

real  \texttt{multi_normal_prec_lupdf(\texttt{row_vectors y | row_vectors mu, matrix Omega)}}

The log of the multivariate normal density of row vector(s) $y$ given location row vector(s) $\mu$ and positive definite precision matrix $\Omega$ dropping constant additive terms

\textit{Available since 2.25}
25.3. Multivariate normal distribution, Cholesky parameterization

Probability density function
If \( K \in \mathbb{N}, \mu \in \mathbb{R}^K, \) and \( L \in \mathbb{R}^{K \times K} \) is lower triangular and such that \( LL^\top \) is positive definite, then for \( y \in \mathbb{R}^K, \)

\[
\text{MultiNormalCholesky}(y|\mu, L) = \text{MultiNormal}(y|\mu, LL^\top).
\]

If \( L \) is lower triangular and \( LL^{top} \) is a \( K \times K \) positive definite matrix, then \( L_{k,k} \) must be strictly positive for \( k \in 1:K \). If an \( L \) is provided that is not the Cholesky factor of a positive-definite matrix, the probability functions will raise errors.

Sampling statement
\( y \sim \text{multi_normal_cholesky}(\mu, L) \)

Increment target log probability density with \( \text{multi_normal_cholesky_lupdf}(y | \mu, L) \).

Available since 2.0

Stan functions
\[
\begin{align*}
\text{real} & \quad \text{multi_normal_cholesky_lpdf}(\text{vectors } y | \text{vectors } \mu, \text{matrix } L) \\
& \quad \text{The log of the multivariate normal density of vector(s) } y \text{ given location vector(s) } \mu \text{ and lower-triangular Cholesky factor of the covariance matrix } L \\
& \quad \text{Available since 2.18} \\
\text{real} & \quad \text{multi_normal_cholesky_lupdf}(\text{vectors } y | \text{vectors } \mu, \text{matrix } L) \\
& \quad \text{The log of the multivariate normal density of vector(s) } y \text{ given location vector(s) } \mu \text{ and lower-triangular Cholesky factor of the covariance matrix } L \text{ dropping constant additive terms} \\
& \quad \text{Available since 2.25} \\
\text{real} & \quad \text{multi_normal_cholesky_lpdf}(\text{vectors } y | \text{row_vectors } \mu, \text{matrix } L) \\
& \quad \text{The log of the multivariate normal density of vector(s) } y \text{ given location row vector(s) } \mu \text{ and lower-triangular Cholesky factor of the covariance matrix } L \\
& \quad \text{Available since 2.18} \\
\text{real} & \quad \text{multi_normal_cholesky_lupdf}(\text{vectors } y | \text{row_vectors } \mu, \text{matrix } L) \\
& \quad \text{The log of the multivariate normal density of vector(s) } y \text{ given location row vector(s) } \mu \text{ and lower-triangular Cholesky factor of the covariance matrix } L \text{ dropping constant additive terms} \\
& \quad \text{Available since 2.25}
\end{align*}
\]
real `multi_normal_cholesky_lpdf`(row_vectors y | vectors mu, matrix L)
The log of the multivariate normal density of row vector(s) y given location vector(s) mu and lower-triangular Cholesky factor of the covariance matrix L  
*Available since 2.18*

real `multi_normal_cholesky_lupdf`(row_vectors y | vectors mu, matrix L)
The log of the multivariate normal density of row vector(s) y given location vector(s) mu and lower-triangular Cholesky factor of the covariance matrix L dropping constant additive terms  
*Available since 2.25*

real `multi_normal_cholesky_lpdf`(row_vectors y | row_vectors mu, matrix L)
The log of the multivariate normal density of row vector(s) y given location row vector(s) mu and lower-triangular Cholesky factor of the covariance matrix L  
*Available since 2.18*

real `multi_normal_cholesky_lupdf`(row_vectors y | row_vectors mu, matrix L)
The log of the multivariate normal density of row vector(s) y given location row vector(s) mu and lower-triangular Cholesky factor of the covariance matrix L dropping constant additive terms  
*Available since 2.25*

vector `multi_normal_cholesky_rng`(vector mu, matrix L)
Generate a multivariate normal variate with location mu and lower-triangular Cholesky factor of the covariance matrix L; may only be used in transformed data and generated quantities blocks  
*Available since 2.3*

vector `multi_normal_cholesky_rng`(row_vector mu, matrix L)
Generate a multivariate normal variate with location mu and lower-triangular Cholesky factor of the covariance matrix L; may only be used in transformed data and generated quantities blocks  
*Available since 2.18*

vectors `multi_normal_cholesky_rng`(vectors mu, matrix L)
Generate an array of multivariate normal variates with locations mu and lower-triangular Cholesky factor of the covariance matrix L; may only be used in transformed data and generated quantities blocks
25.4. MULTIVARIATE GAUSSIAN PROCESS DISTRIBUTION

Available since 2.18

vectors multi_normal_cholesky_rng(row_vectors mu, matrix L)
Generate an array of multivariate normal variates with locations mu and lower-triangular Cholesky factor of the covariance matrix L; may only be used in transformed data and generated quantities blocks

Available since 2.18

25.4. Multivariate Gaussian process distribution

Probability density function
If $K, N \in \mathbb{N}$, $\Sigma \in \mathbb{R}^{N \times N}$ is symmetric, positive definite kernel matrix and $w \in \mathbb{R}^{K}$ is a vector of positive inverse scales, then for $y \in \mathbb{R}^{K \times N}$,

$$
\text{MultiGP}(y|\Sigma, w) = \prod_{i=1}^{K} \text{MultiNormal}(y_{i}|0, w_{i}^{-1}\Sigma),
$$

where $y_{i}$ is the $i$th row of $y$. This is used to efficiently handle Gaussian Processes with multi-variate outputs where only the output dimensions share a kernel function but vary based on their scale. Note that this function does not take into account the mean prediction.

Sampling statement
$y \sim \text{multi_gp}(\Sigma, w)$
Increment target log probability density with multi_gp_lupdf(y | Sigma, w).

Available since 2.3

Stan functions
real multi_gp_lpdf(matrix y | matrix Sigma, vector w)
The log of the multivariate GP density of matrix y given kernel matrix Sigma and inverses scales w
Available since 2.12

real multi_gp_lupdf(matrix y | matrix Sigma, vector w)
The log of the multivariate GP density of matrix y given kernel matrix Sigma and inverses scales w dropping constant additive terms
Available since 2.25
25.5. Multivariate Gaussian process distribution, Cholesky parameterization

Probability density function

If \( K, N \in \mathbb{N}, L \in \mathbb{R}^{N \times N} \) is lower triangular and such that \( LL^\top \) is positive definite kernel matrix (implying \( L_{n,n} > 0 \) for \( n \in 1:N \)), and \( w \in \mathbb{R}^K \) is a vector of positive inverse scales, then for \( y \in \mathbb{R}^{K \times N} \),

\[
\text{MultiGPCholesky}(y \mid L, w) = \prod_{i=1}^{K} \text{MultiNormal}(y_i \mid 0, w_i^{-1}LL^\top),
\]

where \( y_i \) is the \( i \)th row of \( y \). This is used to efficiently handle Gaussian Processes with multi-variate outputs where only the output dimensions share a kernel function but vary based on their scale. If the model allows parameterization in terms of Cholesky factor of the kernel matrix, this distribution is also more efficient than \( \text{MultiGP()} \). Note that this function does not take into account the mean prediction.

Sampling statement

\[ y \sim \text{multi_gp_cholesky}(L, w) \]

Increment target log probability density with \( \text{multi_gp_cholesky_lupdf}(y \mid L, w) \).

Available since 2.5

Stan functions

\begin{align*}
\text{real} \quad & \text{multi_gp_cholesky_lpdf}(\text{matrix } y \mid \text{matrix } L, \text{vector } w) \\
& \text{The log of the multivariate GP density of matrix } y \text{ given lower-triangular Cholesky factor of the kernel matrix } L \text{ and inverses scales } w \\
& \text{Available since 2.12}
\end{align*}

\begin{align*}
\text{real} \quad & \text{multi_gp_cholesky_lupdf}(\text{matrix } y \mid \text{matrix } L, \text{vector } w) \\
& \text{The log of the multivariate GP density of matrix } y \text{ given lower-triangular Cholesky factor of the kernel matrix } L \text{ and inverses scales } w \text{ dropping constant additive terms} \\
& \text{Available since 2.25}
\end{align*}
25.6. Multivariate Student-t distribution

Probability density function

If \( K \in \mathbb{N}, \nu \in \mathbb{R}^+, \mu \in \mathbb{R}^K, \) and \( \Sigma \in \mathbb{R}^{K \times K} \) is symmetric and positive definite, then for \( y \in \mathbb{R}^K, \)

\[
\text{MultiStudentT}(y \mid \nu, \mu, \Sigma) = \frac{1}{\pi^{K/2} \Gamma(\nu/2)} \frac{1}{(\nu+K)/2} \left( \sqrt{\frac{1}{\nu}} (y - \mu) \right)^{(\nu+K)/2} \left( 1 + \frac{1}{\nu} (y - \mu)^\top \Sigma^{-1} (y - \mu) \right)^{-(\nu+K)/2}.
\]

Sampling statement

\( y \sim \text{multi_student_t}(\nu, \mu, \Sigma) \)

Increment target log probability density with \( \text{multi_student_t_lupdf}(y \mid \nu, \mu, \Sigma) \).

Available since 2.0

Stan functions

\textbf{real} \hspace{1em} \textbf{multi_student_t_lpdf}(\text{vectors } y \mid \text{real } \nu, \text{vectors } \mu, \text{matrix } \Sigma)

The log of the multivariate Student-t density of vector(s) \( y \) given degrees of freedom \( \nu \), location vector(s) \( \mu \), and scale matrix \( \Sigma \).

Available since 2.18

\textbf{real} \hspace{1em} \textbf{multi_student_t_lupdf}(\text{vectors } y \mid \text{real } \nu, \text{vectors } \mu, \text{matrix } \Sigma)

The log of the multivariate Student-t density of vector(s) \( y \) given degrees of freedom \( \nu \), location vector(s) \( \mu \), and scale matrix \( \Sigma \) dropping constant additive terms.

Available since 2.25

\textbf{real} \hspace{1em} \textbf{multi_student_t_lpdf}(\text{vectors } y \mid \text{real } \nu, \text{row_vectors } \mu, \text{matrix } \Sigma)

The log of the multivariate Student-t density of vector(s) \( y \) given degrees of freedom \( \nu \), location row vector(s) \( \mu \), and scale matrix \( \Sigma \).

Available since 2.18

\textbf{real} \hspace{1em} \textbf{multi_student_t_lupdf}(\text{vectors } y \mid \text{real } \nu, \text{row_vectors } \mu, \text{matrix } \Sigma)

The log of the multivariate Student-t density of vector(s) \( y \) given degrees of freedom \( \nu \), location row vector(s) \( \mu \), and scale matrix \( \Sigma \) dropping constant additive terms.

Available since 2.25
real `multi_student_t_lpdf`(row_vectors y | real nu, vectors mu, matrix Sigma)
The log of the multivariate Student-t density of row vector(s) y given degrees of
freedom nu, location vector(s) mu, and scale matrix Sigma
Available since 2.18

real `multi_student_t_lupdf`(row_vectors y | real nu, vectors mu, matrix Sigma)
The log of the multivariate Student-t density of row vector(s) y given degrees of
freedom nu, location vector(s) mu, and scale matrix Sigma dropping constant additive terms
Available since 2.25

real `multi_student_t_lpdf`(row_vectors y | real nu, row_vectors mu, matrix Sigma)
The log of the multivariate Student-t density of row vector(s) y given degrees of
freedom nu, location row vector(s) mu, and scale matrix Sigma
Available since 2.18

real `multi_student_t_lupdf`(row_vectors y | real nu, row_vectors mu, matrix Sigma)
The log of the multivariate Student-t density of row vector(s) y given degrees of
freedom nu, location row vector(s) mu, and scale matrix Sigma dropping constant additive terms
Available since 2.25

vector `multi_student_t_rng`(real nu, vector mu, matrix Sigma)
Generate a multivariate Student-t variate with degrees of freedom nu, location
mu, and scale matrix Sigma; may only be used in transformed data and generated
quantities blocks
Available since 2.0

vector `multi_student_t_rng`(real nu, row_vector mu, matrix Sigma)
Generate a multivariate Student-t variate with degrees of freedom nu, location
mu, and scale matrix Sigma; may only be used in transformed data and generated
quantities blocks
Available since 2.18

vectors `multi_student_t_rng`(real nu, vectors mu, matrix Sigma)
Generate an array of multivariate Student-t variates with degrees of freedom nu,
locations mu, and scale matrix Sigma; may only be used in transformed data and
generated quantities blocks
25.7. MULTIVARIATE STUDENT-T DISTRIBUTION, CHOLESKY PARAMETERIZATION

Available since 2.18

vectors multi_student_t_rng(real nu, row_vectors mu, matrix Sigma)
Generate an array of multivariate Student-t variates with degrees of freedom nu, locations mu, and scale matrix Sigma; may only be used in transformed data and generated quantities blocks
Available since 2.18

25.7. Multivariate Student-t distribution, Cholesky parameterization

Probability density function

Let $K \in \mathbb{N}, \nu \in \mathbb{R}^+, \mu \in \mathbb{R}^K$, and $L$ a $K \times K$ lower-triangular matrix with strictly positive, finite diagonal then

$$
\text{MultiStudentTCholesky}(y \mid \nu, \mu, L) = \frac{1}{\pi^{k/2}} \frac{1}{\nu^{k/2}} \frac{\Gamma((\nu+K)/2)}{\Gamma(\nu/2)} \frac{1}{|L|} \left(1 + \frac{1}{\nu} (y - \mu)^\top L^{-T}L^{-1} (y - \mu)\right)^{-(\nu+K)/2}.
$$

Sampling statement

$y \sim \text{multi_student_t_cholesky}(\nu, \mu, L)$

Increment target log probability density with multi_student_t_cholesky_lupdf(y | nu, mu, L).
Available since 2.30

Stan functions

real multi_student_t_cholesky_lpdf(vectors y | real nu, vectors mu, matrix L)
The log of the multivariate Student-t density of vector or array of vectors $y$ given degrees of freedom $nu$, location vector or array of vectors $mu$, and Cholesky factor of the scale matrix $L$. For a definition of the arguments compatible with the vectors type, see the probability vectorization section.
Available since 2.30

real multi_student_t_cholesky_lupdf(vectors y | real nu, vectors mu, matrix L)
The log of the multivariate Student-t density of vector or vector array $y$ given degrees of freedom $nu$, location vector or vector array $mu$, and Cholesky factor of the scale matrix $L$, dropping constant additive terms. For a definition of arguments compatible with the vectors type, see the probability vectorization section.
Available since 2.30
vector \texttt{multi\_student\_t\_cholesky\_rng}(\texttt{real} \ \nu, \ \texttt{vector} \ \mu, \ \texttt{matrix} \ L) 
Generate a multivariate Student-t variate with degrees of freedom \( \nu \), location \( \mu \), and Cholesky factor of the scale matrix \( L \); may only be used in transformed data and generated quantities blocks.

Available since 2.30

array\[\] \texttt{vector} \ \texttt{multi\_student\_t\_cholesky\_rng}(\texttt{real} \ \nu, \ \texttt{array\[\]} \ \texttt{vector} \ \mu, \ \texttt{matrix} \ L) 
Generate a multivariate Student-t variate with degrees of freedom \( \nu \), location array \( \mu \), and Cholesky factor of the scale matrix \( L \); may only be used in transformed data and generated quantities blocks.

Available since 2.30

array\[\] \texttt{vector} \ \texttt{multi\_student\_t\_cholesky\_rng}(\texttt{real} \ \nu, \ \texttt{array\[\]} \ \texttt{row\_vector} \ \mu, \ \texttt{matrix} \ L) 
Generate an array of multivariate Student-t variate with degrees of freedom \( \nu \), location array \( \mu \), and Cholesky factor of the scale matrix \( L \); may only be used in transformed data and generated quantities blocks.

Available since 2.30

### 25.8. Gaussian dynamic linear models

A Gaussian Dynamic Linear model is defined as follows, For \( t \in 1, \ldots, T \),

\[
\begin{align*}
    y_t & \sim N(F'\theta_t, V) \\
    \theta_t & \sim N(G\theta_{t-1}, W) \\
    \theta_0 & \sim N(m_0, C_0)
\end{align*}
\]

where \( y \) is \( n \times T \) matrix where rows are variables and columns are observations.

These functions calculate the log-likelihood of the observations marginalizing over the latent states \( p(y|F,G,V,W,m_0,C_0) \). This log-likelihood is a system that is calculated using the Kalman Filter. If \( V \) is diagonal, then a more efficient algorithm which sequentially processes observations and avoids a matrix inversions can be used (Durbin and Koopman 2001, sec. 6.4).

**Sampling statement**

\[
y \sim \texttt{gaussian\_dlm\_obs}(F, G, V, W, m_0, C_0)
\]

Increment target log probability density with \( \texttt{gaussian\_dlm\_obs\_lupdf}(y \mid F, G, V, W, m_0, C_0) \).

Available since 2.0
Stan functions
The following two functions differ in the type of their $V$, the first taking a full observation covariance matrix $V$ and the second a vector $V$ representing the diagonal of the observation covariance matrix. The sampling statement defined in the previous section works with either type of observation $V$.

```stan
real gaussian_dlm_obs_lpdf(matrix y | matrix F, matrix G, matrix V, matrix W, vector m0, matrix C0)
```
The log of the density of the Gaussian Dynamic Linear model with observation matrix $y$ in which rows are variables and columns are observations, design matrix $F$, transition matrix $G$, observation covariance matrix $V$, system covariance matrix $W$, and the initial state is distributed normal with mean $m0$ and covariance $C0$. $Available since 2.12$

```stan
real gaussian_dlm_obs_lupdf(matrix y | matrix F, matrix G, matrix V, matrix W, vector m0, matrix C0)
```
The log of the density of the Gaussian Dynamic Linear model with observation matrix $y$ in which rows are variables and columns are observations, design matrix $F$, transition matrix $G$, observation covariance matrix $V$, system covariance matrix $W$, and the initial state is distributed normal with mean $m0$ and covariance $C0$. This function drops constant additive terms. $Available since 2.25$

```stan
real gaussian_dlm_obs_lpdf(matrix y | matrix F, matrix G, vector V, matrix W, vector m0, matrix C0)
```
The log of the density of the Gaussian Dynamic Linear model with observation matrix $y$ in which rows are variables and columns are observations, design matrix $F$, transition matrix $G$, observation covariance matrix with diagonal $V$, system covariance matrix $W$, and the initial state is distributed normal with mean $m0$ and covariance $C0$. $Available since 2.12$

```stan
real gaussian_dlm_obs_lupdf(matrix y | matrix F, matrix G, vector V, matrix W, vector m0, matrix C0)
```
The log of the density of the Gaussian Dynamic Linear model with observation matrix $y$ in which rows are variables and columns are observations, design matrix $F$, transition matrix $G$, observation covariance matrix with diagonal $V$, system covariance matrix $W$, and the initial state is distributed normal with mean $m0$ and covariance $C0$. This function drops constant additive terms. $Available since 2.25$
26. Simplex Distributions

The simplex probabilities have support on the unit $K$-simplex for a specified $K$. A $K$-dimensional vector $\theta$ is a unit $K$-simplex if $\theta_k \geq 0$ for $k \in \{1, \ldots, K\}$ and $\sum_{k=1}^{K} \theta_k = 1$.

26.1. Dirichlet distribution

Probability density function

If $K \in \mathbb{N}$ and $\alpha \in (\mathbb{R}^+)^K$, then for $\theta \in K$-simplex,

$$
\text{Dirichlet}(\theta | \alpha) = \frac{\Gamma\left(\sum_{k=1}^{K} \alpha_k\right)}{\prod_{k=1}^{K} \Gamma(\alpha_k)} \prod_{k=1}^{K} \theta_{\alpha_k - 1}.
$$

**Warning:** If any of the components of $\theta$ satisfies $\theta_i = 0$ or $\theta_i = 1$, then the probability is 0 and the log probability is $-\infty$. Similarly, the distribution requires strictly positive parameters, with $\alpha_i > 0$ for each $i$.

**Meaning of Dirichlet parameters**

A symmetric Dirichlet prior is $[\alpha, \ldots, \alpha]^T$. To code this in Stan,

```stan
data {
  int<lower=1> K;
  real<lower=0> alpha;
}
generated quantities {
  vector[K] theta = dirichlet_rng(rep_vector(alpha, K));
}
```

Taking $K = 10$, here are the first five draws for $\alpha = 1$. For $\alpha = 1$, the distribution is uniform over simplexes.

1) 0.17 0.05 0.07 0.17 0.03 0.13 0.03 0.03 0.27 0.05
2) 0.08 0.02 0.12 0.07 0.52 0.01 0.07 0.04 0.01 0.06
3) 0.02 0.03 0.22 0.29 0.17 0.10 0.09 0.00 0.05 0.03
4) 0.04 0.03 0.21 0.13 0.04 0.01 0.10 0.04 0.22 0.18
5) 0.11 0.22 0.02 0.01 0.06 0.18 0.33 0.04 0.01 0.01
That does not mean it’s uniform over the marginal probabilities of each element. As the size of the simplex grows, the marginal draws become more and more concentrated below (not around) $1/K$. When one component of the simplex is large, the others must all be relatively small to compensate. For example, in a uniform distribution on 10-simplexes, the probability that a component is greater than the mean of $1/10$ is only 39%. Most of the posterior marginal probability mass for each component is in the interval $(0,0.1)$.

When the $\alpha$ value is small, the draws gravitate to the corners of the simplex. Here are the first five draws for $\alpha = 0.001$.

1) 3e-203 0e+00 2e-298 9e-106 1e+000 0e+00 0e+000 1e-047 0e+00 4e-279
2) 1e+000 0e+00 5e-279 2e-014 1e-275 0e+00 3e-285 9e-147 0e+00 0e+000
3) 1e-308 0e+00 1e-213 0e+000 0e+000 8e-75 0e+000 1e+000 4e-58 7e-112
4) 6e-166 5e-65 3e-068 3e-147 0e+000 1e+00 3e-249 0e+000 0e+00 0e+000
5) 2e-091 0e+00 0e+000 0e+000 1e-060 0e+00 4e-312 1e+000 0e+00 0e+000

Each row denotes a draw. Each draw has a single value that rounds to one and other values that are very close to zero or rounded down to zero.

As $\alpha$ increases, the draws become increasingly uniform. For $\alpha = 1000$,

1) 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10
2) 0.10 0.10 0.09 0.10 0.10 0.10 0.11 0.10 0.10 0.10
3) 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10
4) 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10
5) 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10 0.10

**Sampling statement**

```stan
theta ~ dirichlet(alpha)
```

Increment target log probability density with `dirichlet_lupdf(theta | alpha)`. 
*Available since 2.0*

**Stan functions**

The Dirichlet probability functions are overloaded to allow the simplex $\theta$ and prior counts (plus one) $\alpha$ to be vectors or row vectors (or to mix the two types). The density functions are also vectorized, so they allow arrays of row vectors or
vectors as arguments; see section vectorized function signatures for a description of vectorization.

```cpp
real dirichlet_lpdf(vectors theta | vectors alpha)
```
The log of the Dirichlet density for simplex(es) theta given prior counts (plus one) alpha

*Available since 2.12, vectorized in 2.21*

```cpp
real dirichlet_lupdf(vectors theta | vectors alpha)
```
The log of the Dirichlet density for simplex(es) theta given prior counts (plus one) alpha dropping constant additive terms

*Available since 2.25*

```cpp
vector dirichlet_rng(vector alpha)
```
Generate a Dirichlet variate with prior counts (plus one) alpha; may only be used in transformed data and generated quantities blocks

*Available since 2.0*
27. Correlation Matrix Distributions

The correlation matrix distributions have support on the (Cholesky factors of) correlation matrices. A Cholesky factor \( L \) for a \( K \times K \) correlation matrix \( \Sigma \) of dimension \( K \) has rows of unit length so that the diagonal of \( LL^\top \) is the unit \( K \)-vector. Even though models are usually conceptualized in terms of correlation matrices, it is better to operationalize them in terms of their Cholesky factors. If you are interested in the posterior distribution of the correlations, you can recover them in the generated quantities block via

```plaintext
generated quantities {
  corr_matrix[K] Sigma;
  Sigma = multiply_lower_tri_self_transpose(L);
}
```

27.1. LKJ correlation distribution

Probability density function

For \( \eta > 0 \), if \( \Sigma \) a positive-definite, symmetric matrix with unit diagonal (i.e., a correlation matrix), then

\[
\text{LkjCorr}(\Sigma|\eta) \propto \det(\Sigma)^{(\eta-1)}.
\]

The expectation is the identity matrix for any positive value of the shape parameter \( \eta \), which can be interpreted like the shape parameter of a symmetric beta distribution:

- if \( \eta = 1 \), then the density is uniform over correlation matrices of order \( K \);
- if \( \eta > 1 \), the identity matrix is the modal correlation matrix, with a sharper peak in the density at the identity matrix for larger \( \eta \); and
- for \( 0 < \eta < 1 \), the density has a trough at the identity matrix.
- if \( \eta \) were an unknown parameter, the Jeffreys prior is proportional to

\[
\sqrt{2 \sum_{k=1}^{K-1} \left( \psi_1 \left( \eta + \frac{K-k-1}{2} \right) - 2\psi_1 \left( 2\eta + K - k - 1 \right) \right)},
\]

where \( \psi_1() \) is the trigamma function.

See (Lewandowski, Kurowicka, and Joe 2009) for definitions. However, it is much
better computationally to work directly with the Cholesky factor of $\Sigma$, so this distribution should never be explicitly used in practice.

**Sampling statement**

```
y ~ lkj_corr(eta)
```

Increment target log probability density with `lkj_corr_lupdf(y | eta)`.

*Available since 2.3*

**Stan functions**

```
real lkj_corr_lpdf(matrix y | real eta)
```

The log of the LKJ density for the correlation matrix $y$ given nonnegative shape $eta$. `lkj_corr_cholesky_lpdf` is faster, more numerically stable, uses less memory, and should be preferred to this.

*Available since 2.12*

```
real lkj_corr_lupdf(matrix y | real eta)
```

The log of the LKJ density for the correlation matrix $y$ given nonnegative shape $eta$ dropping constant additive terms. `lkj_corr_cholesky_lupdf` is faster, more numerically stable, uses less memory, and should be preferred to this.

*Available since 2.25*

```
matrix lkj_corr_rng(int K, real eta)
```

Generate a LKJ random correlation matrix of order $K$ with shape $eta$; may only be used in transformed data and generated quantities blocks

*Available since 2.0*

### 27.2. Cholesky LKJ correlation distribution

Stan provides an implicit parameterization of the LKJ correlation matrix density in terms of its Cholesky factor, which you should use rather than the explicit parameterization in the previous section. For example, if $L$ is a Cholesky factor of a correlation matrix, then

```
L ~ lkj_corr_cholesky(2.0);  # implies L * L' ~ lkj_corr(2.0);
```

Because Stan requires models to have support on all valid constrained parameters, $L$ will almost always\(^1\) be a parameter declared with the type of a Cholesky factor for a correlation matrix; for example,

\(^1\)It is possible to build up a valid $L$ within Stan, but that would then require Jacobian adjustments to imply the intended posterior.
27.2. CHOLESKY LKJ CORRELATION DISTRIBUTION

**parameters** 
{ cholesky_factor_corr[K] L;  # rather than corr_matrix[K]

**Probability density function**

For $\eta > 0$, if $L$ is a $K \times K$ lower-triangular Cholesky factor of a symmetric positive-definite matrix with unit diagonal (i.e., a correlation matrix), then

$$
\text{LkjCholesky}(L | \eta) \propto |J| \det(LL^\top)^{(\eta-1)} = \prod_{k=2}^{K} L_{kk}^{K-k+2\eta-2}.
$$

See the previous section for details on interpreting the shape parameter $\eta$. Note that even if $\eta = 1$, it is still essential to evaluate the density function because the density of $L$ is not constant, regardless of the value of $\eta$, even though the density of $LL^\top$ is constant iff $\eta = 1$.

A lower triangular $L$ is a Cholesky factor for a correlation matrix if and only if $L_{k,k} > 0$ for $k \in 1:K$ and each row $L_k$ has unit Euclidean length.

**Sampling statement**

$L \sim \text{lkj_corr_cholesky}(\eta)$

Increment target log probability density with $\text{lkj_corr_cholesky_lupdf}(L | \eta)$.

*Available since 2.4*

**Stan functions**

- `real lkj_corr_cholesky_lpdf(matrix L | real eta)`
  The log of the LKJ density for the lower-triangular Cholesky factor $L$ of a correlation matrix given shape $\eta$
  *Available since 2.12*

- `real lkj_corr_cholesky_lupdf(matrix L | real eta)`
  The log of the LKJ density for the lower-triangular Cholesky factor $L$ of a correlation matrix given shape $\eta$ dropping constant additive terms
  *Available since 2.25*

- `matrix lkj_corr_cholesky_rng(int K, real eta)`
  Generate a random Cholesky factor of a correlation matrix of order $K$ that is distributed LKJ with shape $\eta$; may only be used in transformed data and generated quantities blocks
  *Available since 2.4*
28. Covariance Matrix Distributions

The covariance matrix distributions have support on symmetric, positive-definite $K \times K$ matrices or their Cholesky factors (square, lower triangular matrices with positive diagonal elements).

28.1. Wishart distribution

Probability density function

If $K \in \mathbb{N}$, $\nu \in (K - 1, \infty)$, and $S \in \mathbb{R}^{K \times K}$ is symmetric and positive definite, then for symmetric and positive-definite $W \in \mathbb{R}^{K \times K}$,

$$
\text{Wishart}(W \mid \nu, S) = \frac{1}{2^{vK/2}} \frac{1}{\Gamma_K(\frac{\nu}{2})} |S|^{-\nu/2} |W|^{(\nu-K-1)/2} \exp\left(-\frac{1}{2} \text{tr}\left(S^{-1}W\right)\right),
$$

where $\text{tr}(\cdot)$ is the matrix trace function, and $\Gamma_K(\cdot)$ is the multivariate Gamma function,

$$
\Gamma_K(x) = \frac{1}{\pi^{K(K-1)/4}} \prod_{k=1}^{K} \Gamma\left(x + \frac{1-k}{2}\right).
$$

Sampling statement

$W \sim \text{wishart}(\nu, \Sigma)$

Increment target log probability density with $\text{wishart_lupdf}(W \mid \nu, \Sigma)$.

Available since 2.0

Stan functions

real $\text{wishart_lpdf}(\text{matrix } W \mid \text{real } \nu, \text{matrix } \Sigma)$

Return the log of the Wishart density for symmetric and positive-definite matrix $W$ given degrees of freedom $\nu$ and symmetric and positive-definite scale matrix $\Sigma$.

Available since 2.12

real $\text{wishart_lupdf}(\text{matrix } W \mid \text{real } \nu, \text{matrix } \Sigma)$

Return the log of the Wishart density for symmetric and positive-definite matrix $W$ given degrees of freedom $\nu$ and symmetric and positive-definite scale matrix $\Sigma$ dropping constant additive terms.

Available since 2.25
matrix wishart_rng(real nu, matrix Sigma)

Generate a Wishart variate with degrees of freedom nu and symmetric and positive-definite scale matrix Sigma; may only be used in transformed data and generated quantities blocks.

Available since 2.0

28.2. Wishart distribution, Cholesky Parameterization

The Cholesky parameterization of the Wishart distribution uses a Cholesky factor for both the variate and the parameter. If $S$ and $W$ are positive definite matrices with Cholesky factors $L_S$ and $L_W$ (i.e., $S = L_S L_S^\top$ and $W = L_W L_W^\top$), then the Cholesky parameterization is defined so that

$$L_W \sim \text{WishartCholesky}(\nu, L_S)$$

if and only if

$$W \sim \text{Wishart}(\nu, S).$$

Probability density function

If $K \in \mathbb{N}$, $\nu \in (K - 1, \infty)$, and $L_S, L_W \in \mathbb{R}^{K \times K}$ are lower triangular matrixes with positive diagonal elements, then the Cholesky parameterized Wishart density is

$$\text{WishartCholesky}(L_W | \nu, L_S) = \text{Wishart}(L_W L_W^\top | \nu, L_S L_S^\top) \left| J_{f^{-1}} \right|,$$

where $J_{f^{-1}}$ is the Jacobian of the (inverse) transform of the variate, $f^{-1}(L_W) = L_W L_W^\top$. The log absolute determinant is

$$\log \left| J_{f^{-1}} \right| = K \log(2) + \sum_{k=1}^{K} (K - k + 1) \log (L_W)_{k,k}.$$

The probability functions will raise errors if $\nu \leq K - 1$ or if $L_S$ and $L_W$ are not Cholesky factors (square, lower-triangular matrices with positive diagonal elements) of the same size.

Stan functions

real wishart_cholesky_lpdf(matrix L_W | real nu, matrix L_S)

Return the log of the Wishart density for lower-triangular Cholesky factor $L_W$ given degrees of freedom $nu$ and lower-triangular Cholesky factor of the scale matrix $L_S$.

Available since 2.30

real wishart_cholesky_lupdf(matrix L_W | real nu, matrix L_S)

Return the log of the Wishart density for lower-triangular Cholesky factor of $L_W$
given degrees of freedom \( \nu \) and lower-triangular Cholesky factor of the scale matrix \( L_S \) dropping constant additive terms. 

*Available since 2.30*

**matrix wishart_cholesky_rng(real nu, matrix L_S)**

Generate the Cholesky factor of a Wishart variate with degrees of freedom \( \nu \) and lower-triangular Cholesky factor of the scale matrix \( L_S \); may only be used in transformed data and generated quantities blocks

*Available since 2.30*

### 28.3. Inverse Wishart distribution

**Probability density function**

If \( K \in \mathbb{N}, \nu \in (K-1, \infty) \), and \( S \in \mathbb{R}^{K \times K} \) is symmetric and positive definite, then for symmetric and positive-definite \( W \in \mathbb{R}^{K \times K} \),

\[
\text{InvWishart}(W | \nu, S) = \frac{1}{2^{\nu K/2}} \frac{1}{\Gamma_K(\nu/2)} |S|^{\nu/2} |W|^{-(\nu+K+1)/2} \exp\left(-\frac{1}{2} \text{tr}(SW^{-1})\right).
\]

**Sampling statement**

\[ W \sim \text{inv_wishart}(\nu, \Sigma) \]

Increment target log probability density with \( \text{inv_wishart_lupdf}(W | \nu, \Sigma) \).

*Available since 2.0*

**Stan functions**

*real inv_wishart_lpdf(matrix W | real nu, matrix Sigma)*

Return the log of the inverse Wishart density for symmetric and positive-definite matrix \( W \) given degrees of freedom \( \nu \) and symmetric and positive-definite scale matrix \( \Sigma \).

*Available since 2.12*

*real inv_wishart_lupdf(matrix W | real nu, matrix Sigma)*

Return the log of the inverse Wishart density for symmetric and positive-definite matrix \( W \) given degrees of freedom \( \nu \) and symmetric and positive-definite scale matrix \( \Sigma \) dropping constant additive terms.

*Available since 2.25*

*matrix inv_wishart_rng(real nu, matrix Sigma)*

Generate an inverse Wishart variate with degrees of freedom \( \nu \) and symmetric and positive-definite scale matrix \( \Sigma \); may only be used in transformed data and
28.4. Inverse Wishart distribution, Cholesky Parameterization

The Cholesky parameterization of the inverse Wishart distribution uses a Cholesky factor for both the variate and the parameter. If $S$ and $W$ are positive definite matrices with Cholesky factors $L_S$ and $L_W$ (i.e., $S = L_S L_S^\top$ and $W = L_W L_W^\top$), then the Cholesky parameterization is defined so that

$$L_W \sim \text{InvWishartCholesky}(\nu, L_S)$$

if and only if

$$W \sim \text{InvWishart}(\nu, S).$$

Probability density function

If $K \in \mathbb{N}$, $\nu \in (K - 1, \infty)$, and $L_S, L_W \in \mathbb{R}^{K \times K}$ are lower triangular matrices with positive diagonal elements, then the Cholesky parameterized inverse Wishart density is

$$\text{InvWishartCholesky}(L_W | \nu, L_S) = \text{InvWishart}(L_W L_W^\top | \nu, L_S L_S^\top) \left| f^{-1} \right|,$$

where $f^{-1}$ is the Jacobian of the (inverse) transform of the variate, $f^{-1}(L_W) = L_W L_W^\top$. The log absolute determinant is

$$\log \left| f^{-1} \right| = K \log(2) + \sum_{k=1}^{K} (K - k + 1) \log (L_W)_{k,k}.$$ 

The probability functions will raise errors if $\nu \leq K - 1$ or if $L_S$ and $L_W$ are not Cholesky factors (square, lower-triangular matrices with positive diagonal elements) of the same size.

Stan functions

real inv_wishart_cholesky_lpdf(matrix L_W | real nu, matrix L_S)
Return the log of the inverse Wishart density for lower-triangular Cholesky factor $L_W$ given degrees of freedom $\nu$ and lower-triangular Cholesky factor of the scale matrix $L_S$.

Available since 2.30

real inv_wishart_cholesky_lupdf(matrix L_W | real nu, matrix L_S)
Return the log of the inverse Wishart density for lower-triangular Cholesky factor...
of $L_W$ given degrees of freedom $\nu$ and lower-triangular Cholesky factor of the scale matrix $L_S$ dropping constant additive terms.

*Available since 2.30*

matrix `inv_wishart_cholesky_rng`(real $\nu$, matrix $L_S$)

Generate the Cholesky factor of an inverse Wishart variate with degrees of freedom $\nu$ and lower-triangular Cholesky factor of the scale matrix $L_S$; may only be used in transformed data and generated quantities blocks.

*Available since 2.30*
Additional Distributions
29. Hidden Markov Models

An elementary first-order Hidden Markov model is a probabilistic model over \( N \) observations, \( y_n \), and \( N \) hidden states, \( x_n \), which can be fully defined by the conditional distributions \( p(y_n \mid x_n, \phi) \) and \( p(x_n \mid x_{n-1}, \phi) \). Here we make the dependency on additional model parameters, \( \phi \), explicit. When \( x \) is continuous, the user can explicitly encode these distributions in Stan and use Markov chain Monte Carlo to integrate \( x \) out.

When each state \( x \) takes a value over a discrete and finite set, say \( \{1, 2, ..., K\} \), we can take advantage of the dependency structure to marginalize \( x \) and compute \( p(y \mid \phi) \). We start by defining the conditional observational distribution, stored in a \( K \times N \) matrix \( \omega \) with

\[
\omega_{kn} = p(y_n \mid x_n = k, \phi).
\]

Next, we introduce the \( K \times K \) transition matrix, \( \Gamma \), with

\[
\Gamma_{ij} = p(x_n = j \mid x_{n-1} = i, \phi).
\]

Each row defines a probability distribution and must therefore be a simplex (i.e. its components must add to 1). Currently, Stan only supports stationary transitions where a single transition matrix is used for all transitions. Finally we define the initial state \( K \)-vector \( \rho \), with

\[
\rho_k = p(x_0 = k \mid \phi).
\]

The Stan functions that support this type of model are special in that the user does not explicitly pass \( y \) and \( \phi \) as arguments. Instead, the user passes \( \log \omega \), \( \Gamma \), and \( \rho \), which in turn depend on \( y \) and \( \phi \).

29.1. Stan functions

```
real hmm_marginal(matrix log_omega, matrix Gamma, vector rho)
```

Returns the log probability density of \( y \), with \( x_n \) integrated out at each iteration. 

*Available since 2.24*

The arguments represent (1) the log density of each output, (2) the transition matrix, and (3) the initial state vector.

- \( \log_\omega \): \( \log \omega_{kn} = \log p(y_n \mid x_n = k, \phi) \), log density of each output,
29.1. STAN FUNCTIONS

- **Gamma**: \( \Gamma_{ij} = p(x_n = j | x_{n-1} = i, \phi) \), the transition matrix,
- **rho**: \( \rho_k = p(x_0 = k | \phi) \), the initial state probability.

```stan
array[] int hmm_latent_rng(matrix log_omega, matrix Gamma, vector rho)
```

Returns a length \( N \) array of integers over \{1, ..., K\}, sampled from the joint posterior distribution of the hidden states, \( p(x | \phi, y) \). May be only used in transformed data and generated quantities.

*Available since 2.24*

```stan
matrix hmm_hidden_state_prob(matrix log_omega, matrix Gamma, vector rho)
```

Returns the matrix of marginal posterior probabilities of each hidden state value. This will be a \( K \times N \) matrix. The \( n^{th} \) column is a simplex of probabilities for the \( n^{th} \) variable. Moreover, let \( A \) be the output. Then \( A_{ij} = p(x_j = i | \phi, y) \). This function may only be used in transformed data and generated quantities.

*Available since 2.24*
Appendix
30. Mathematical Functions

This appendix provides the definition of several mathematical functions used throughout the manual.

30.1. Beta

The beta function, \( B(a, b) \), computes the normalizing constant for the beta distribution, and is defined for \( a > 0 \) and \( b > 0 \) by

\[
B(a, b) = \int_0^1 u^{a-1} (1 - u)^{b-1} \, du = \frac{\Gamma(a) \Gamma(b)}{\Gamma(a + b)},
\]

where \( \Gamma(x) \) is the Gamma function.

30.2. Incomplete beta

The incomplete beta function, \( B(x; a, b) \), is defined for \( x \in [0, 1] \) and \( a, b \geq 0 \) such that \( a + b \neq 0 \) by

\[
B(x; a, b) = \int_0^x u^{a-1} (1 - u)^{b-1} \, du,
\]

where \( B(a, b) \) is the beta function defined in appendix. If \( x = 1 \), the incomplete beta function reduces to the beta function, \( B(1; a, b) = B(a, b) \).

The regularized incomplete beta function divides the incomplete beta function by the beta function,

\[
I_x(a, b) = \frac{B(x; a, b)}{B(a, b)}.
\]

30.3. Gamma

The gamma function, \( \Gamma(x) \), is the generalization of the factorial function to continuous variables, defined so that for positive integers \( n \),

\[
\Gamma(n+1) = n!
\]

Generalizing to all positive numbers and non-integer negative numbers,

\[
\Gamma(x) = \int_0^\infty u^{x-1} \exp(-u) \, du.
\]
30.4. Digamma

The digamma function \( \Psi \) is the derivative of the log \( \Gamma \) function,

\[
\Psi(u) = \frac{d}{du} \log \Gamma(u) = \frac{1}{\Gamma(u)} \frac{d}{du} \Gamma(u).
\]
